Intro

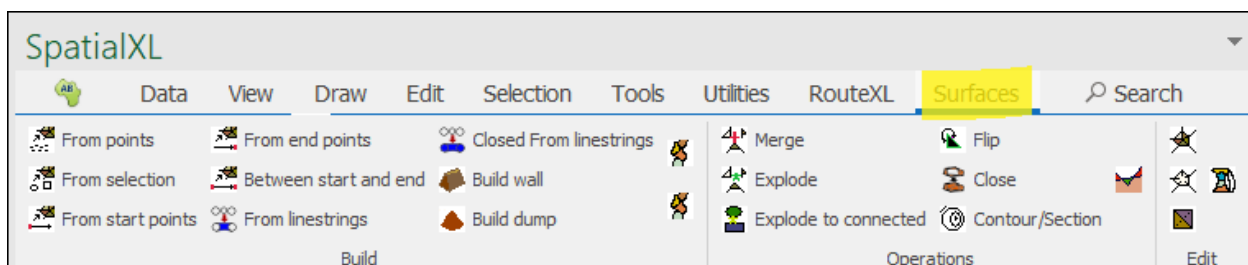

This is a manual on all the features available with SurfaceIQ. SurfaceIQ is an add-in to SpatialXL and all our other spatial products that allows you to build and work with surfaces of various kinds.

To see if you have SurfaceIQ look in the **Application Menu**> **View Addins**:

The tools and features available from SurfaceIQ are to be found in the **Surfaces** tab:

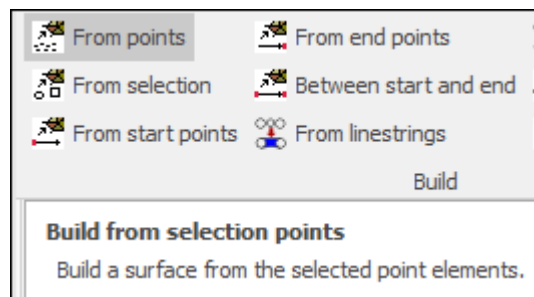

We will start by covering the features in the **Build** section of the tab:

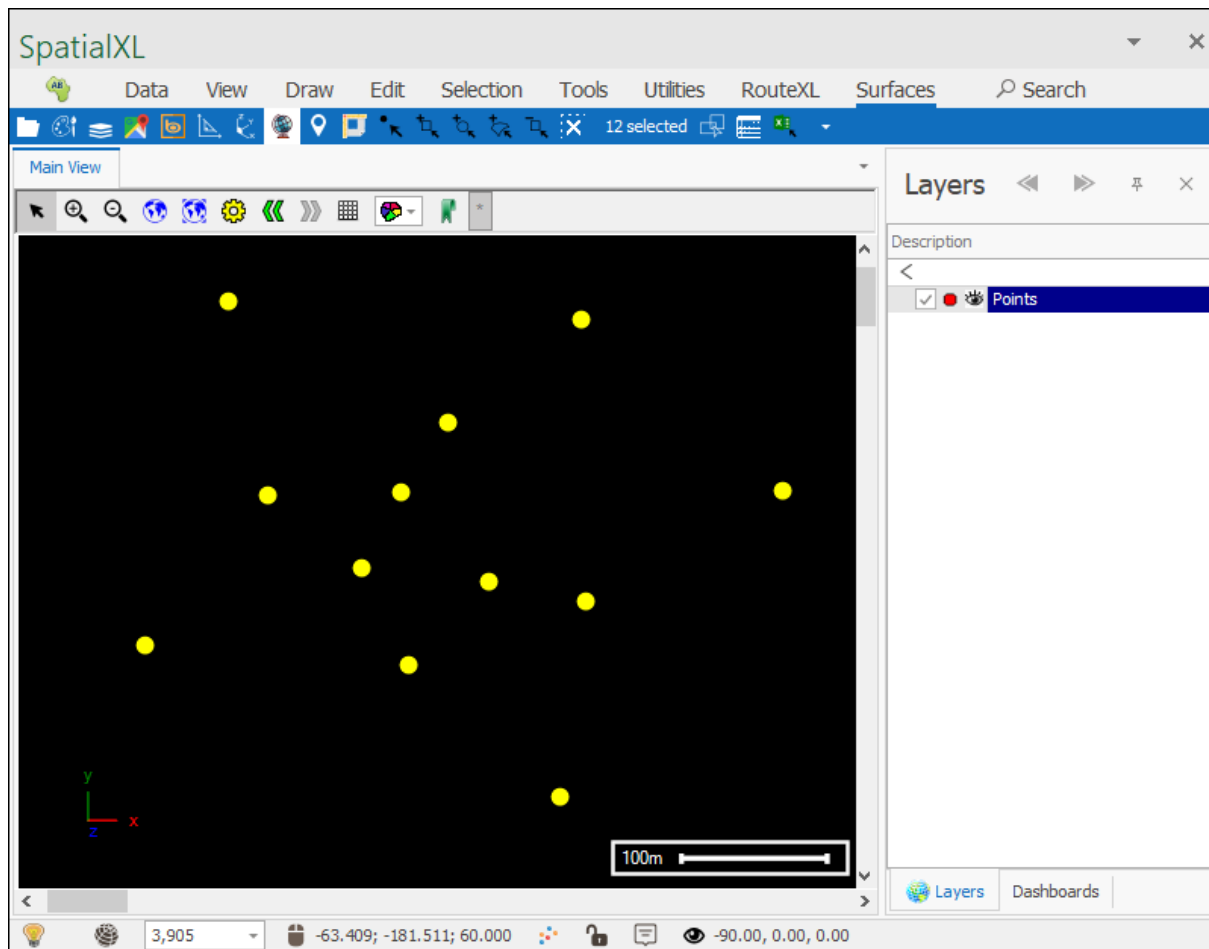

Build

From Points

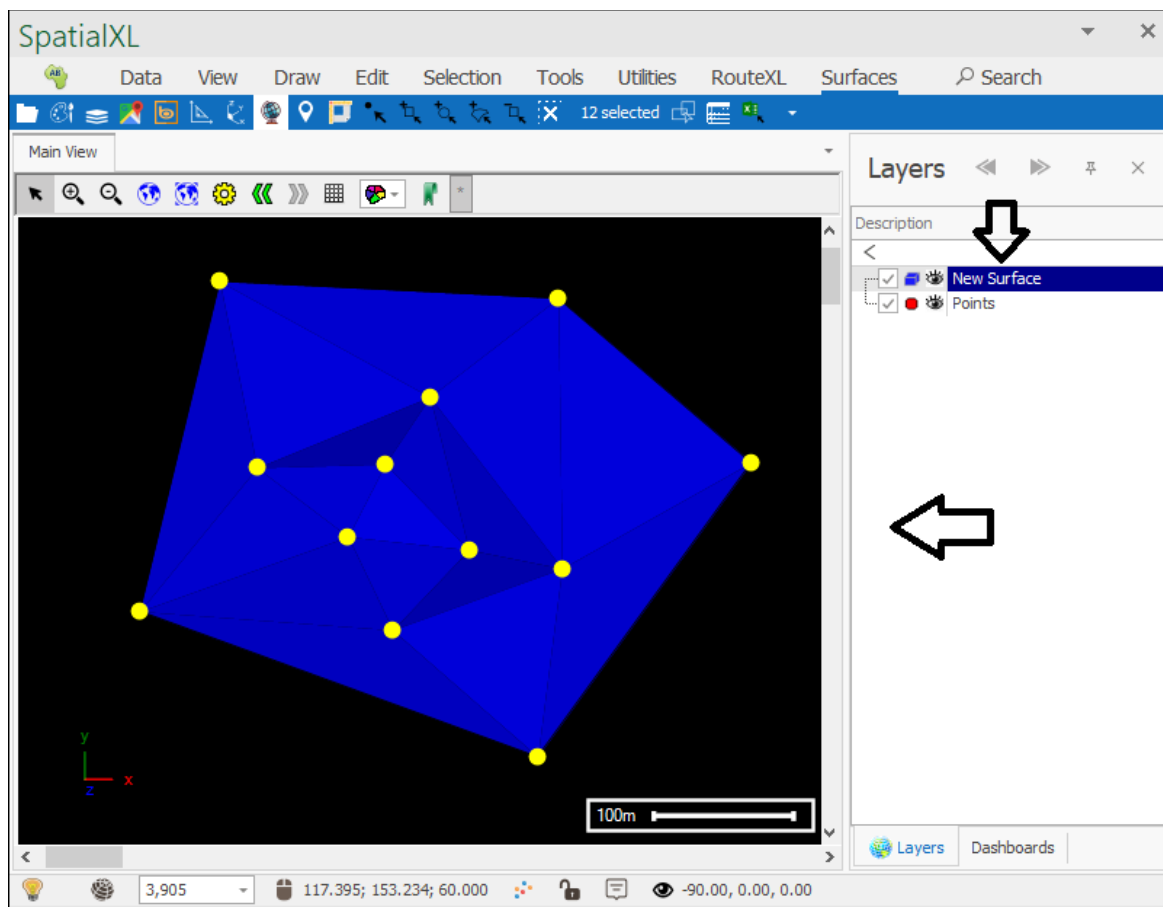

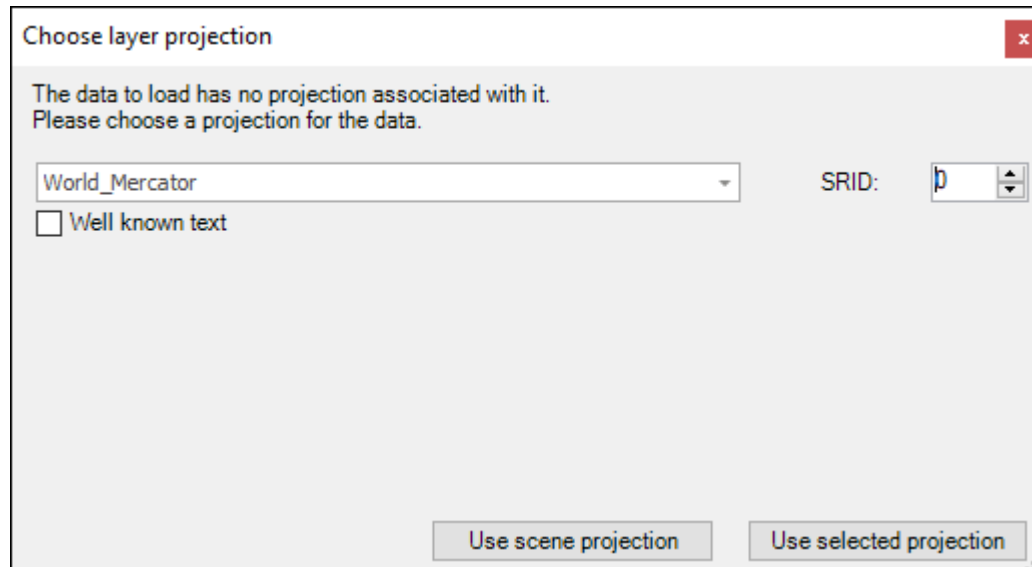

First we have the **From points** tool which will build a surface from selected points in your scene:

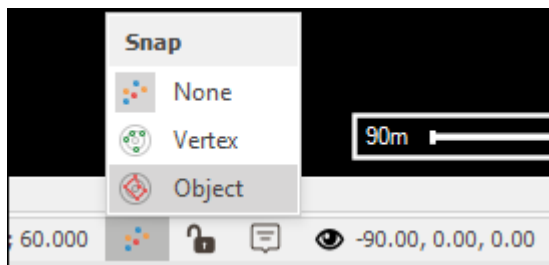

As the first step always, we start by selecting the elements in the scene that we would like to build a surface out of:

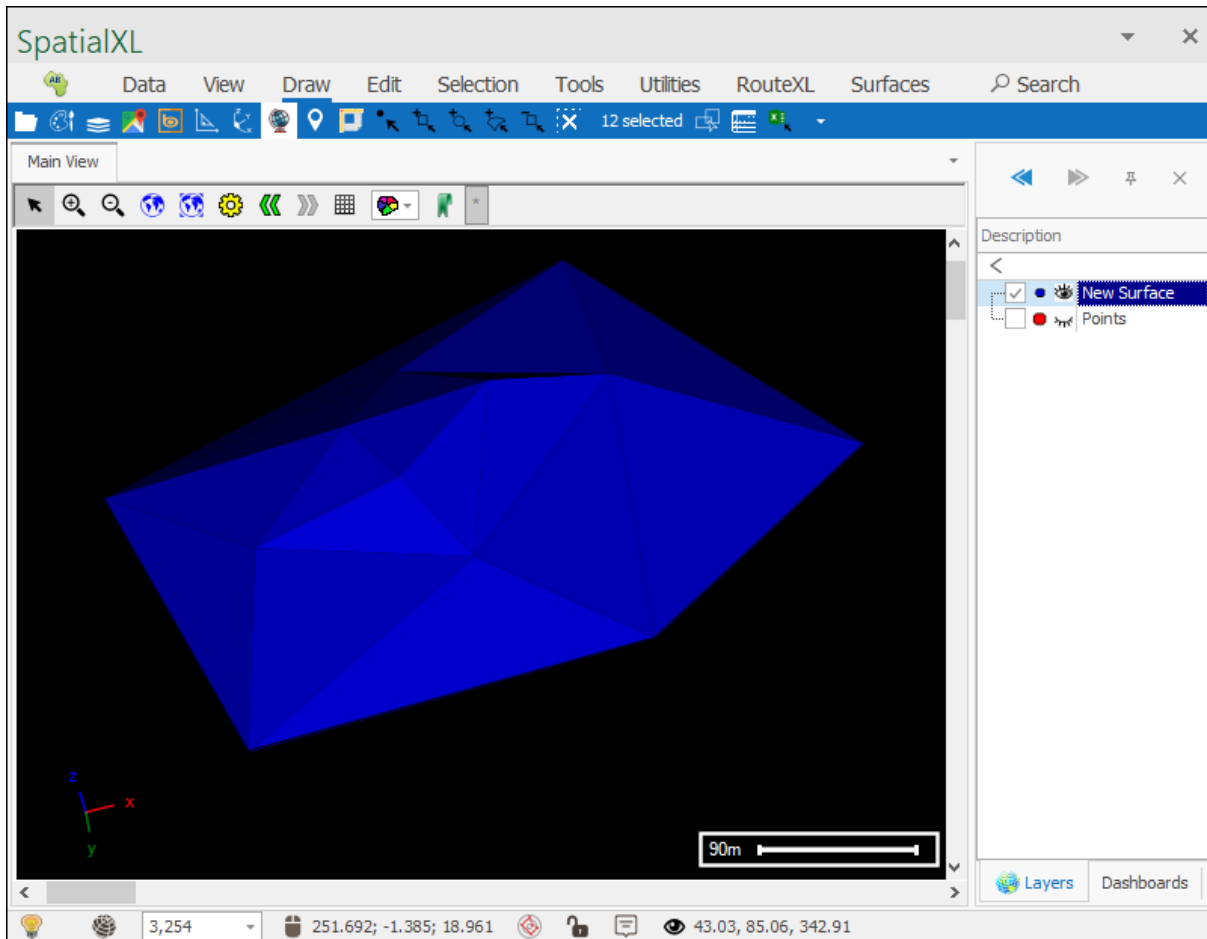

You can then go ahead and click **From points**. Now, any surface you create will be drawn to any layer that you have set as active, if you have no layer set as active then you will be prompted to create a new layer, you will just be asked to choose the projection and then your new layer will be created for you:

Your surface has been created and you can then turn off the points layer and rotate the surface to see it clearly. To rotate a surface or any 3D object simply choose one of the **Snap** tools by clicking here at the bottom of the spatial pane:

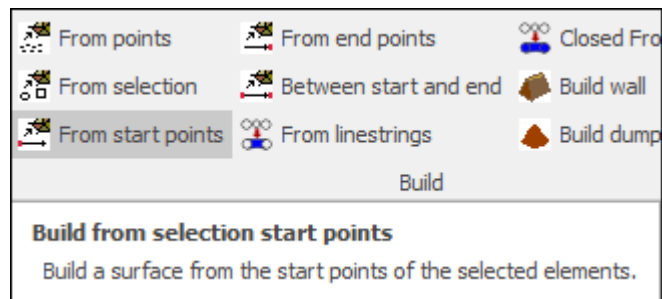

Then hover your mouse over your surface until the cursor turns into a star figure (this means it has found a point to snap to) and then hold down ctrl and click and drag to rotate your surface around:

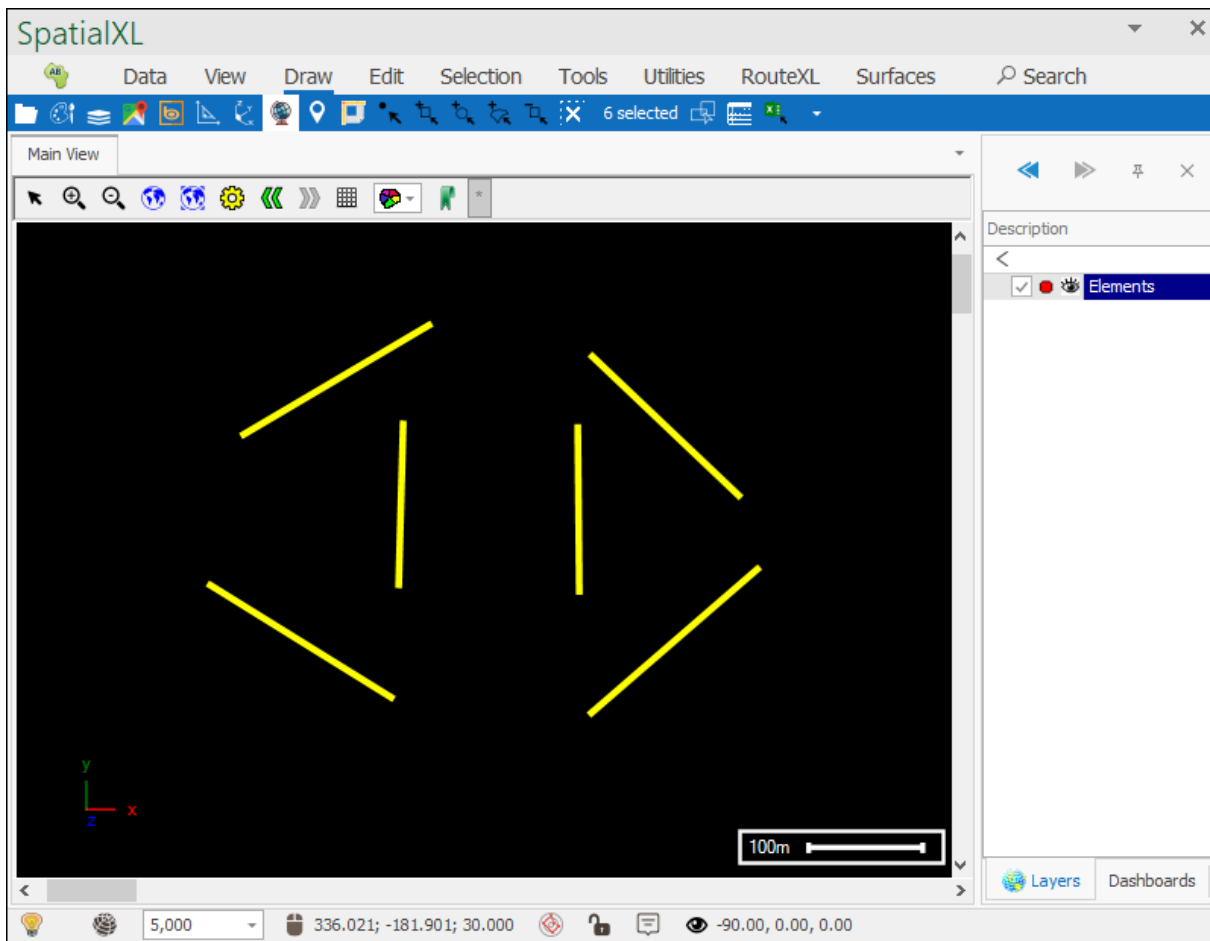

From start points

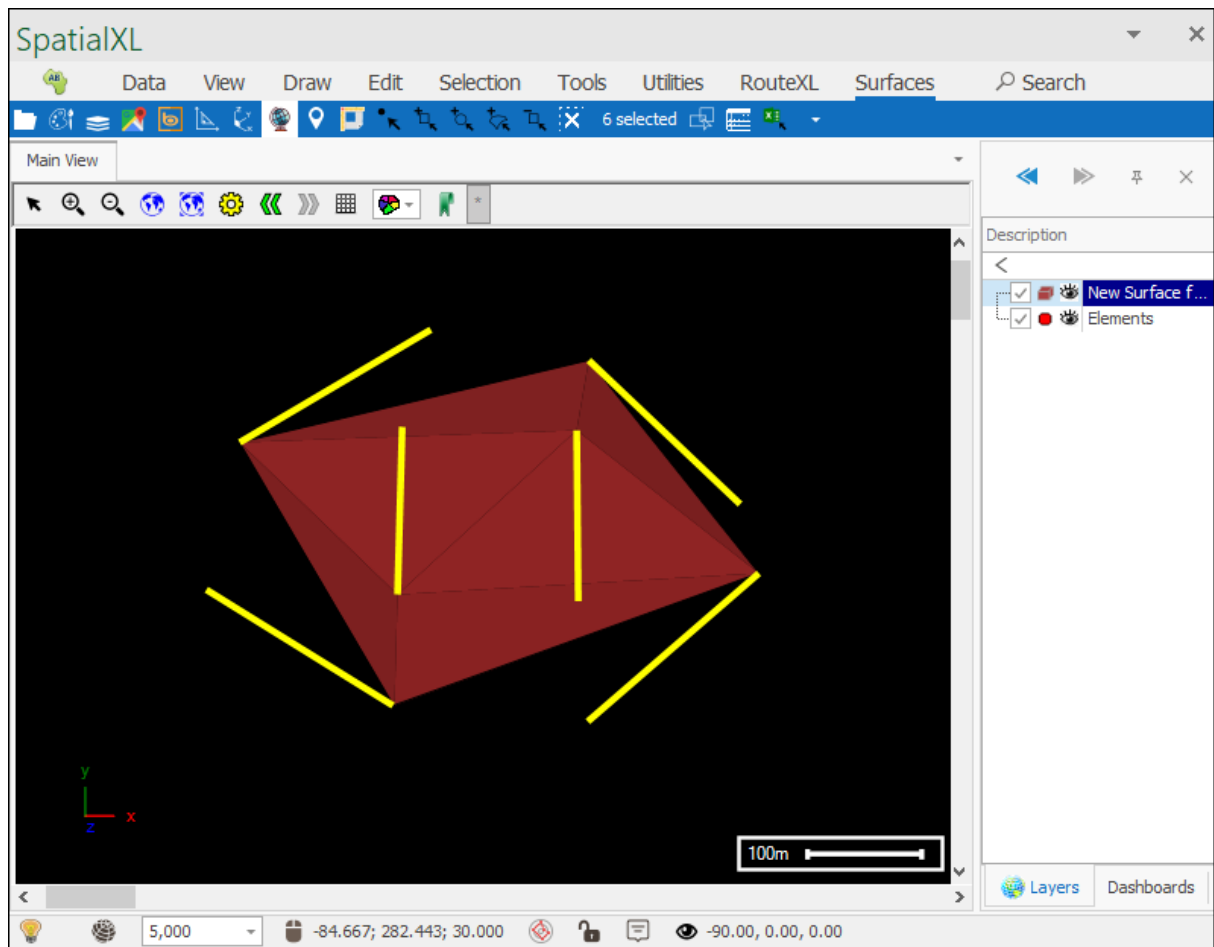

Next is the **From start points** tool which will build a surface from the start points of selected elements only:

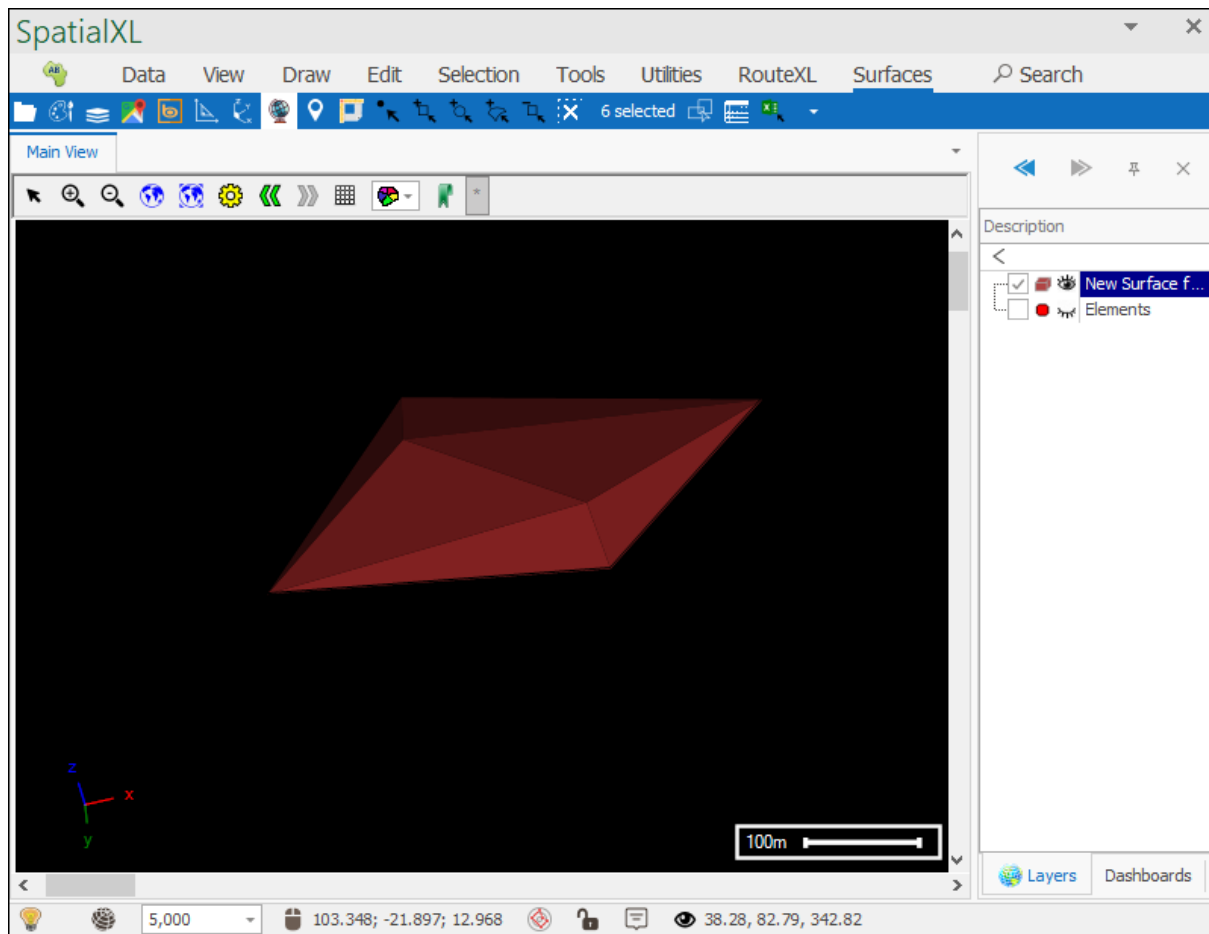

First select the elements:

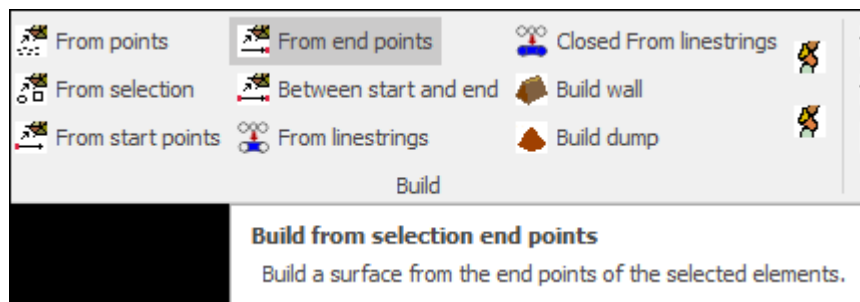

Then click **From start points** and your surface will be created:

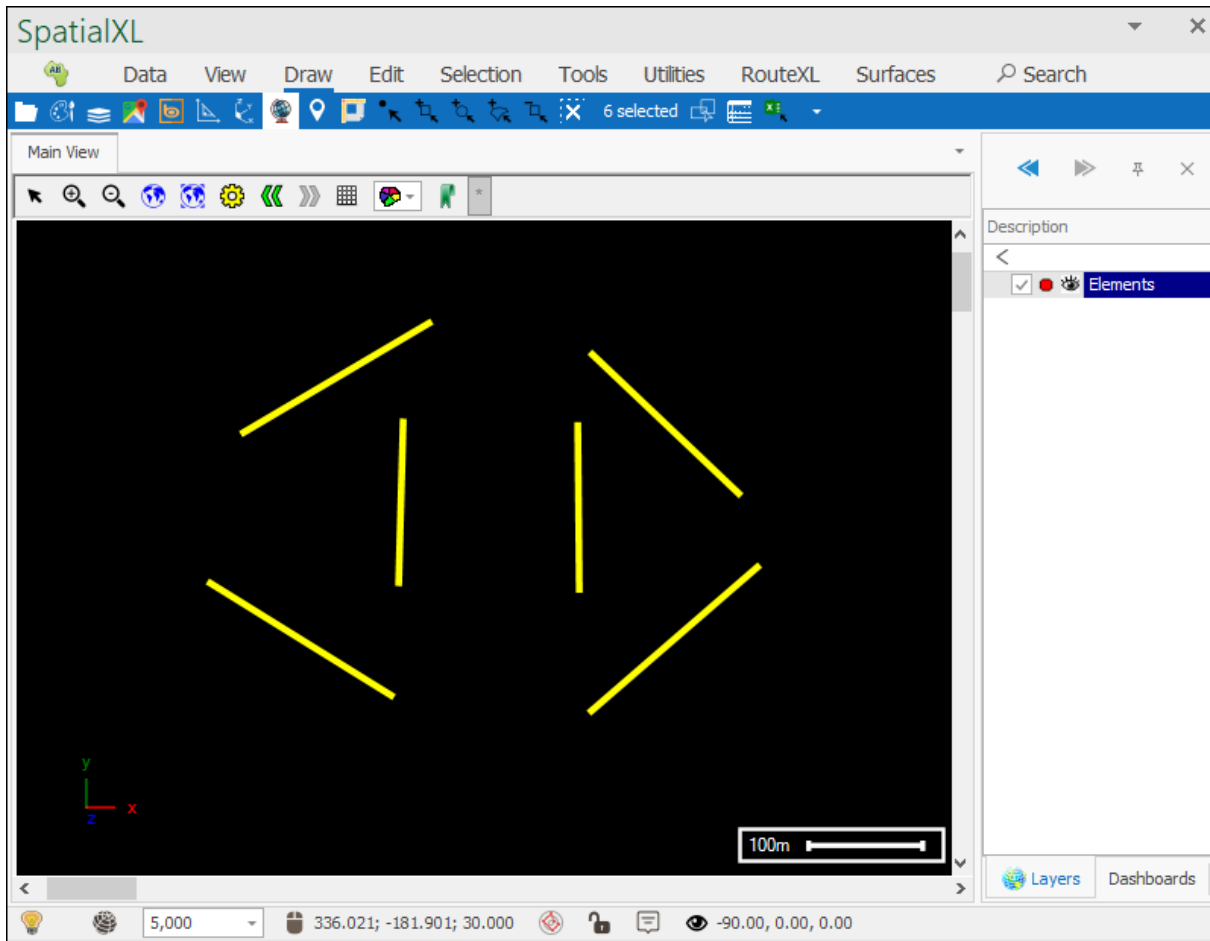

From end points

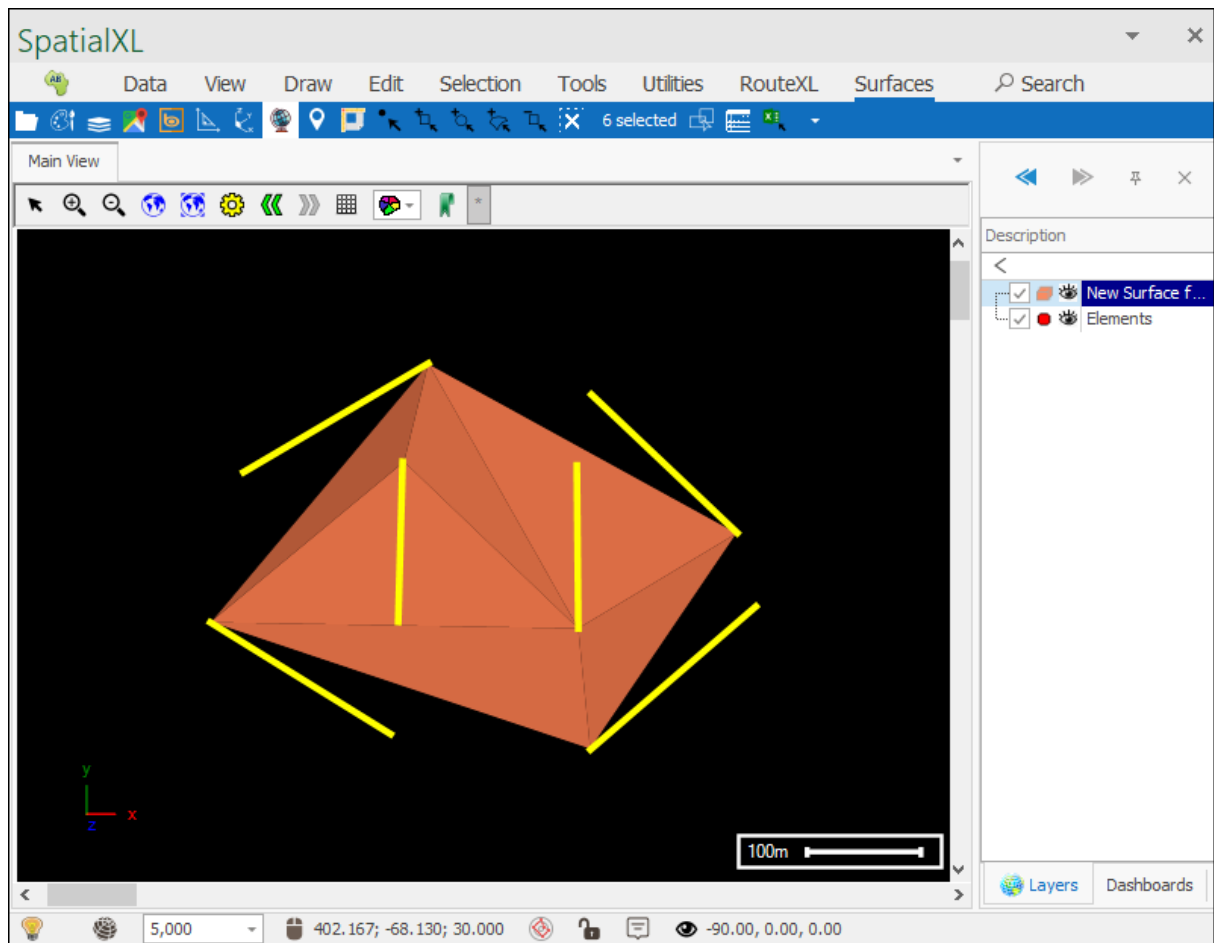

Next is the **From end points** tool which will build a surface from the end points of selected elements only:

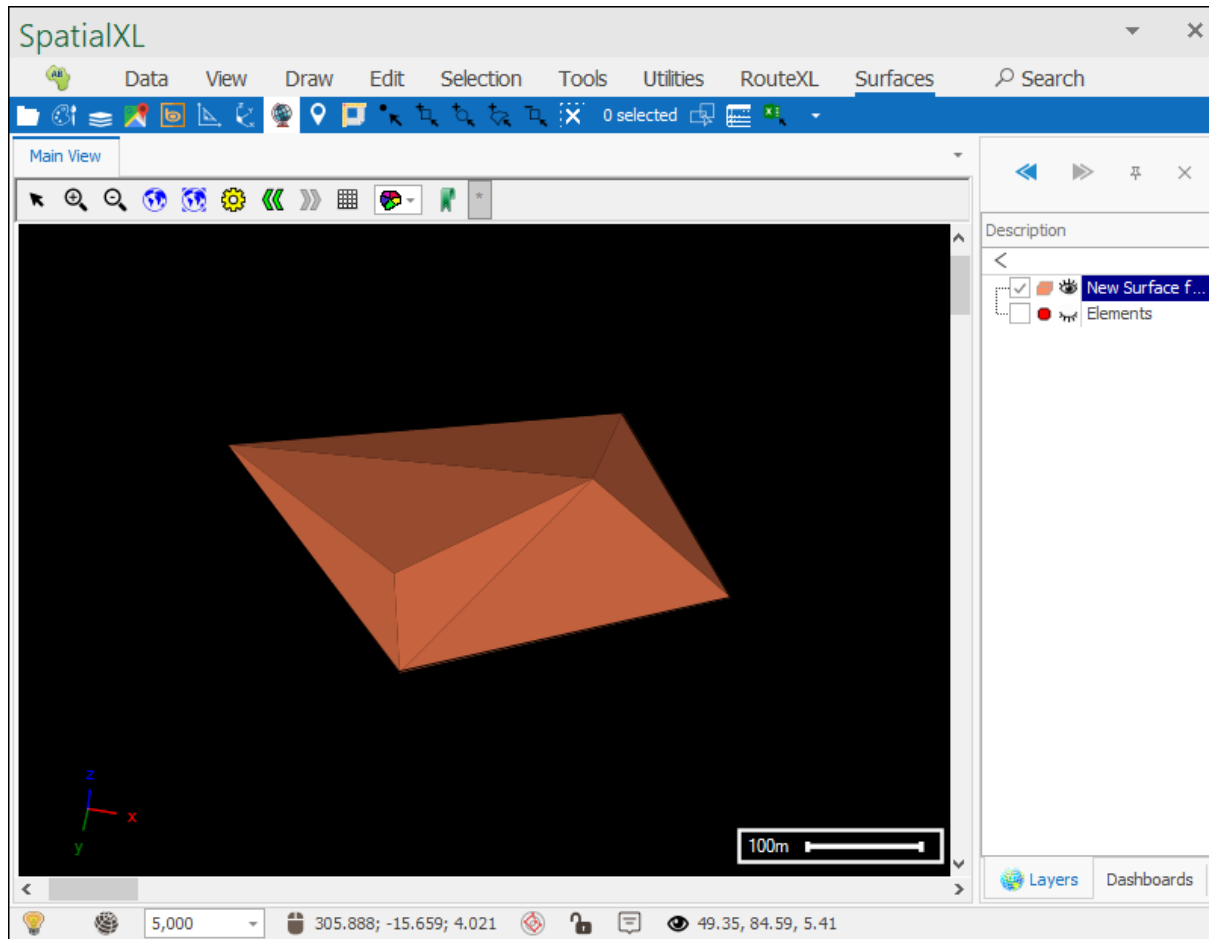

First select your elements:

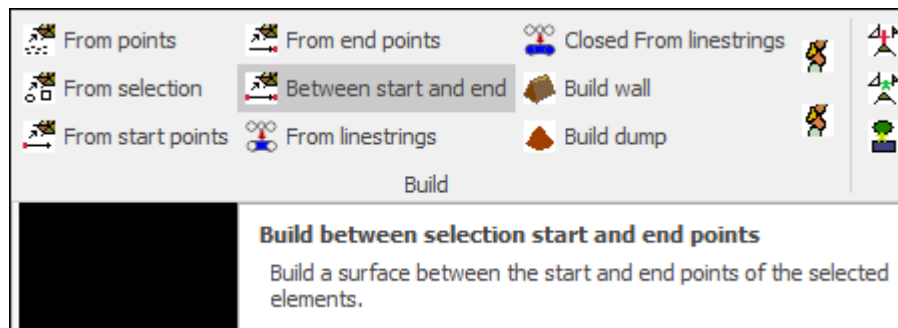

Then click **From end points** and your surface will be created:

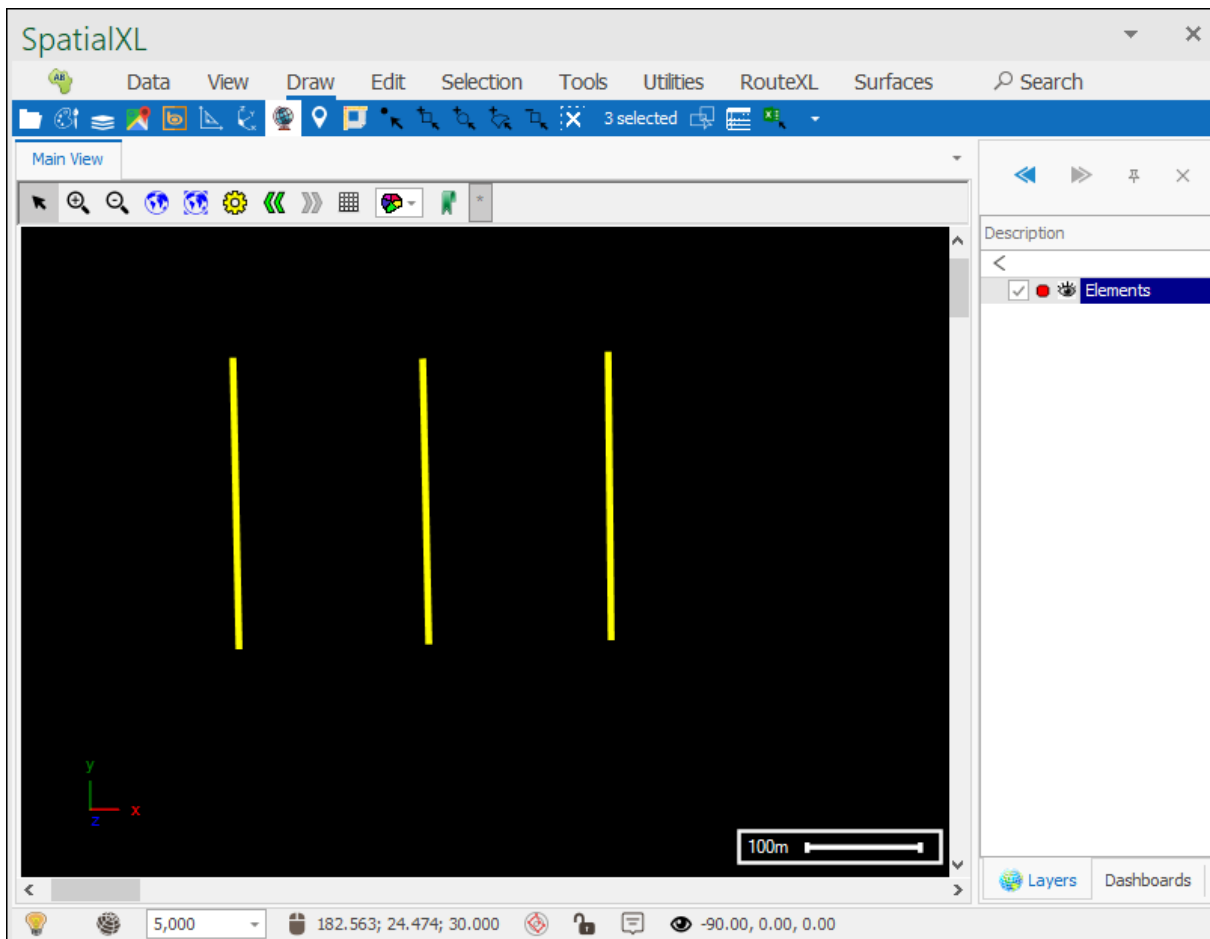

Between start and end points

Next we have the **Between start and end** tool which will build a surface between the start and end points of selected elements:

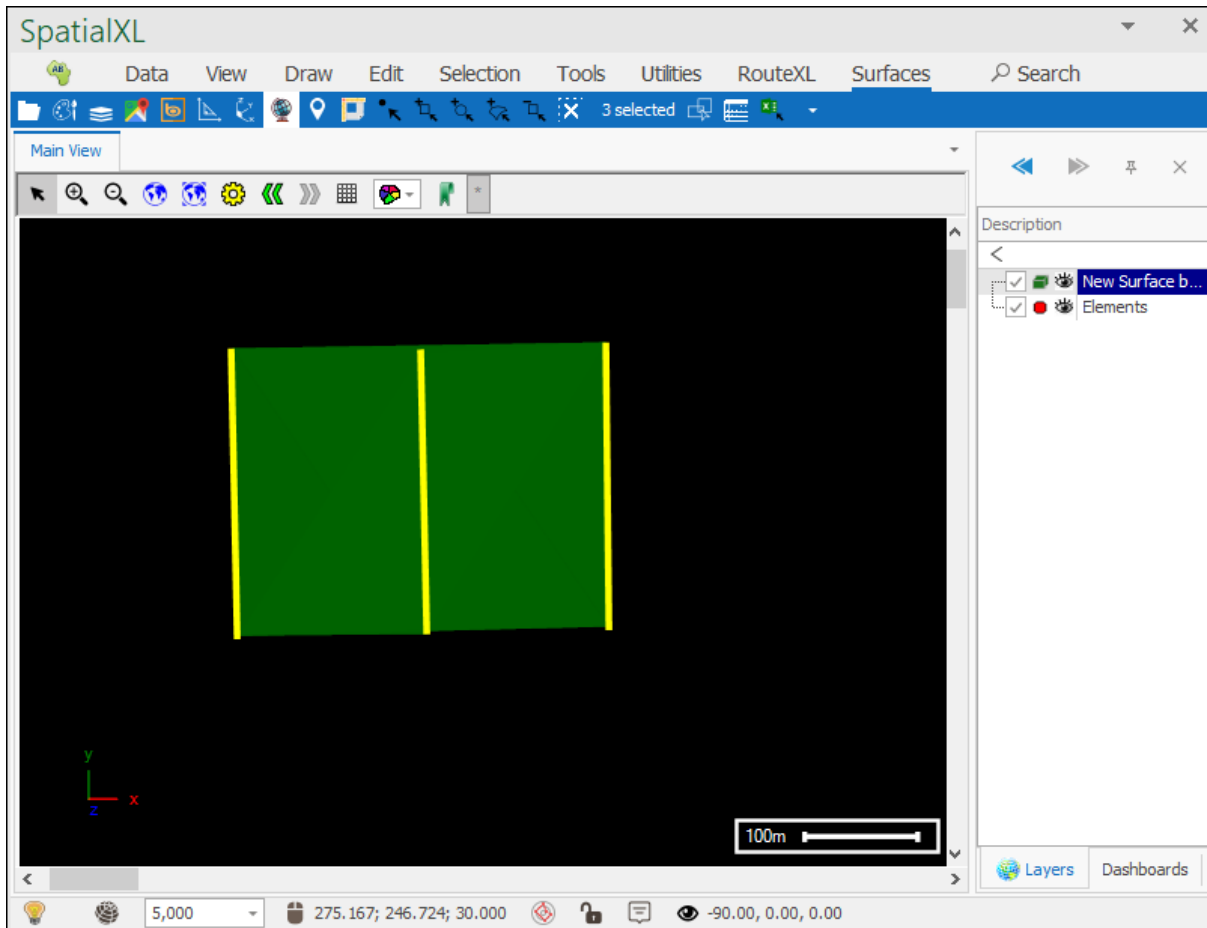

First select the elements:

Then click **Between start and end** and your surface will be created:

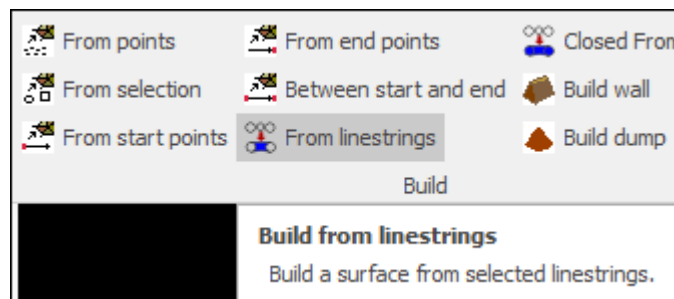

SurfaceIQ User Guide

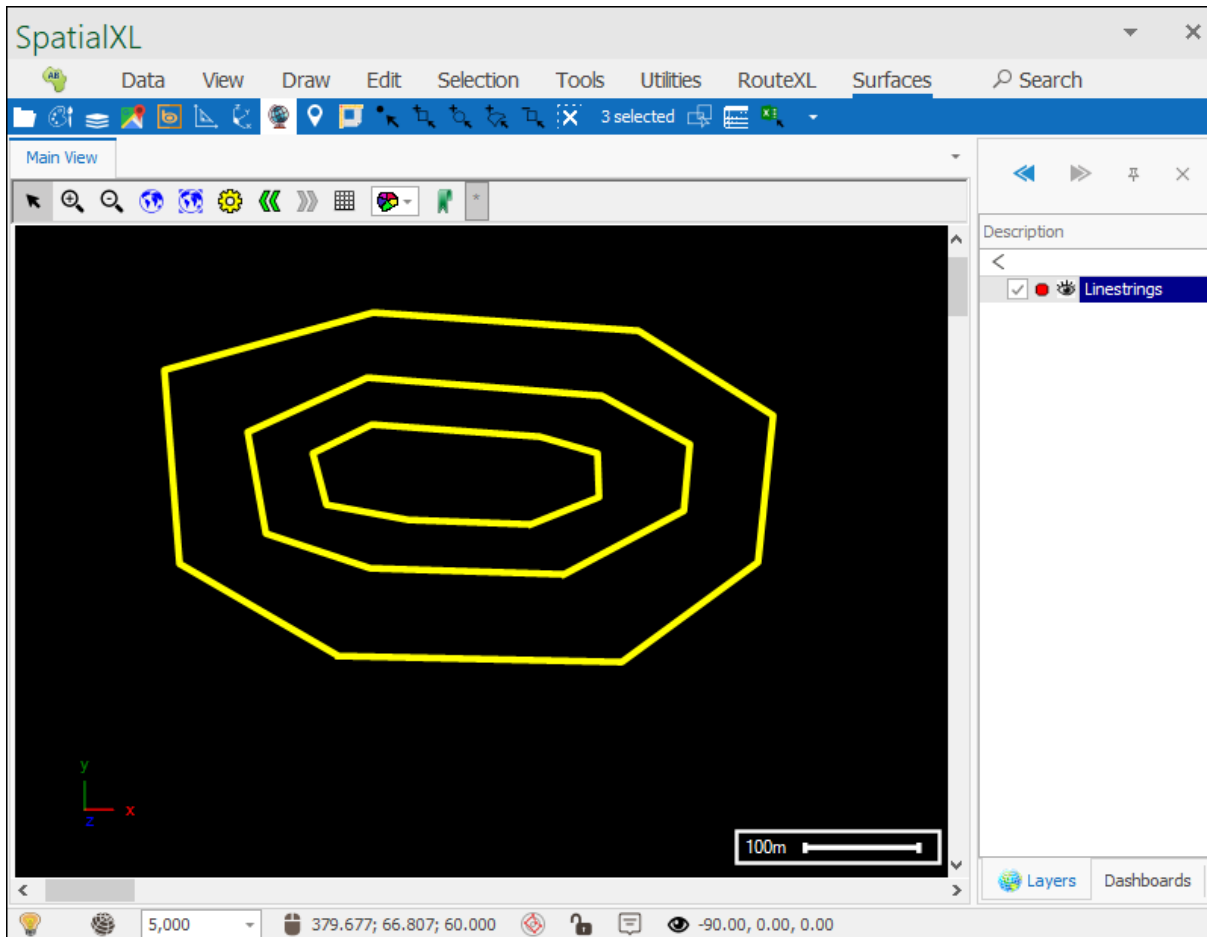

From linestrings

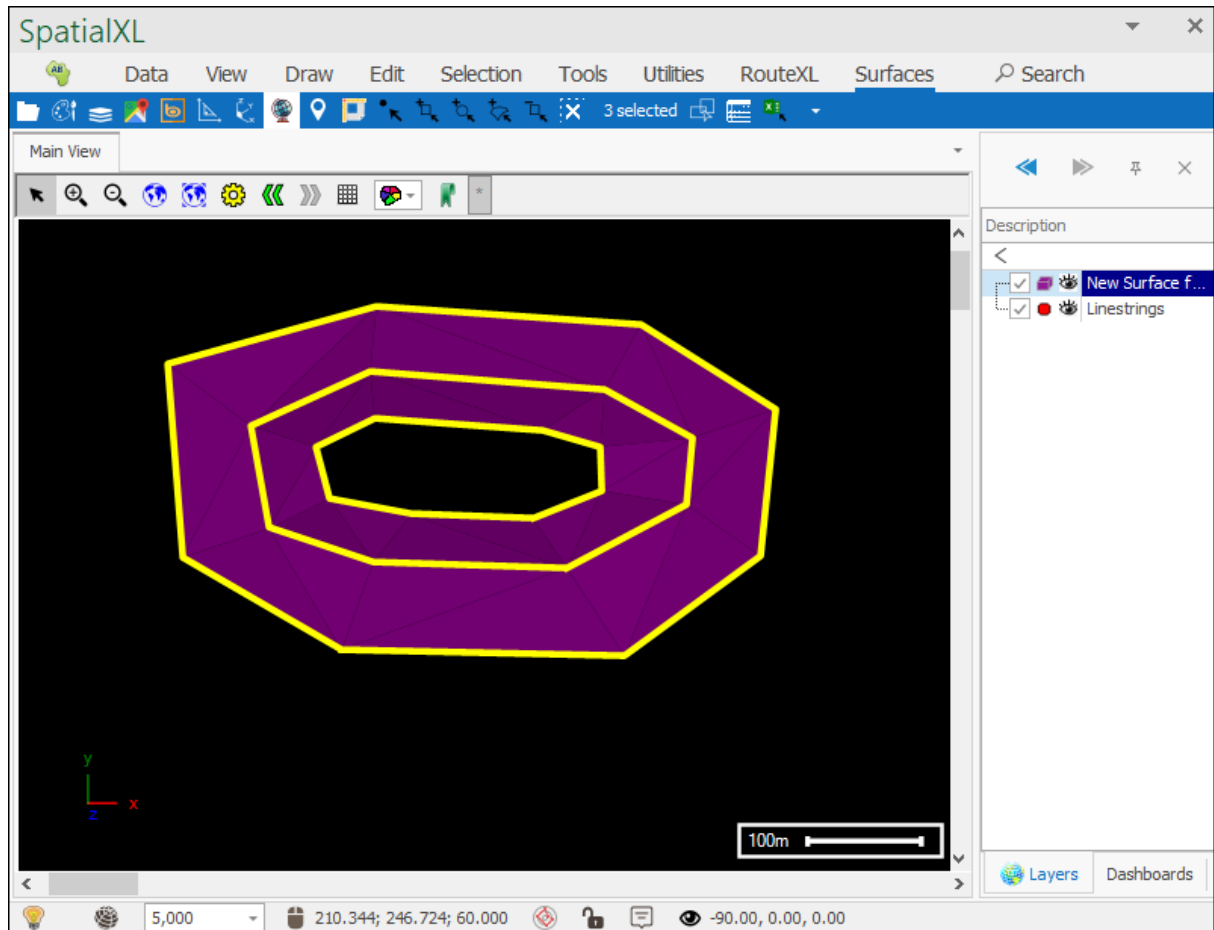

The next tool is the **From linestrings** tool which will build a surface from selected linestrings:

Select the linestrings:

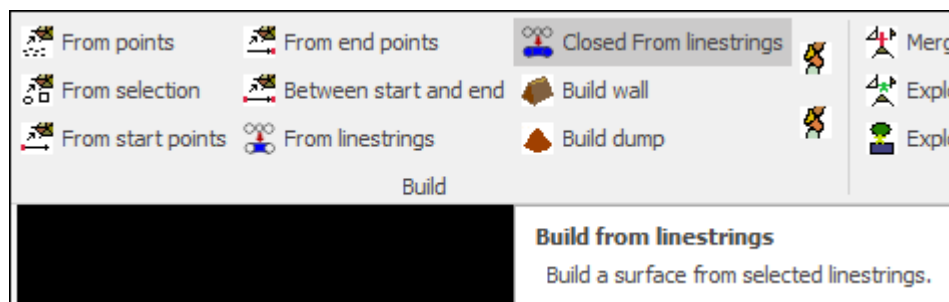

Then click **From linestrings** and your surface will be created:

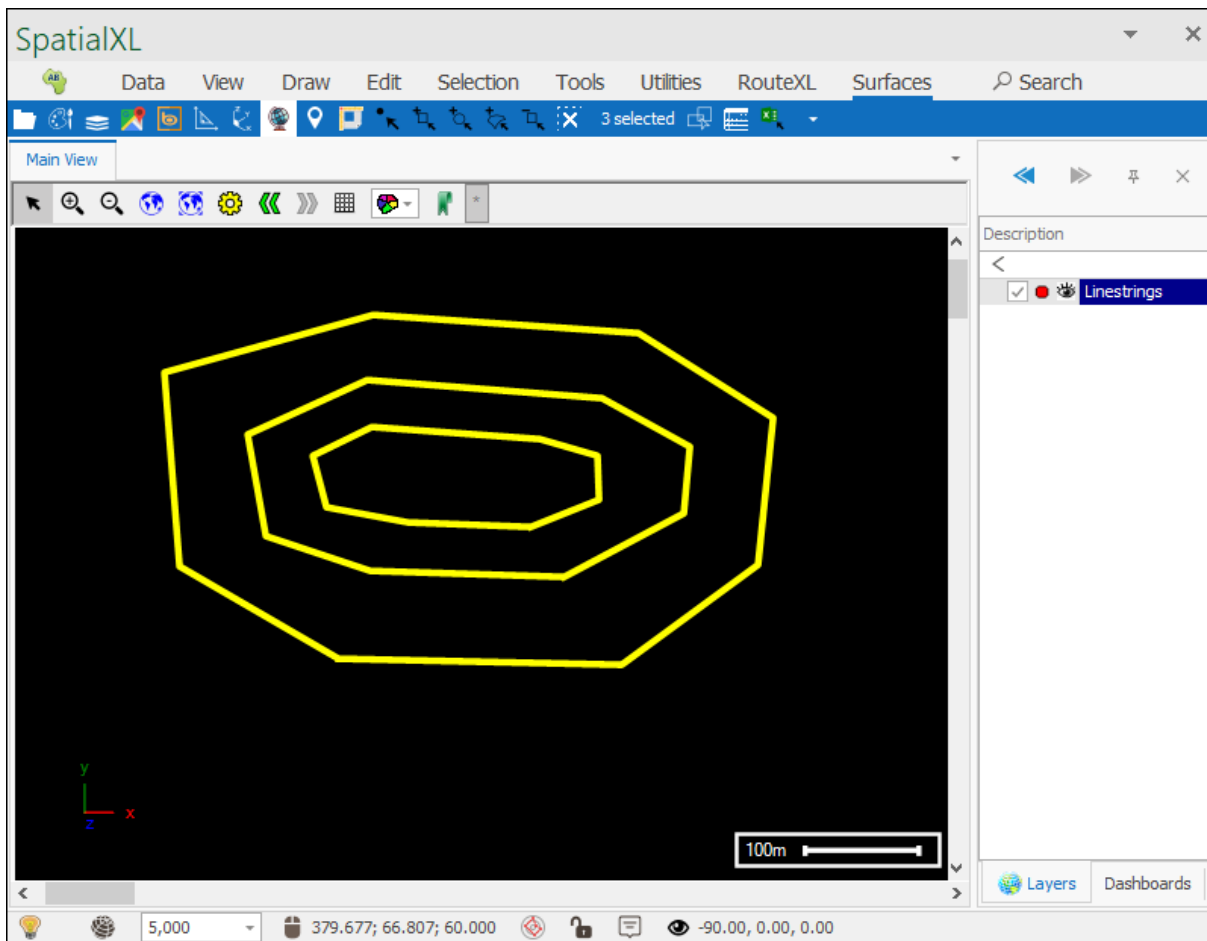

Closed from linestrings

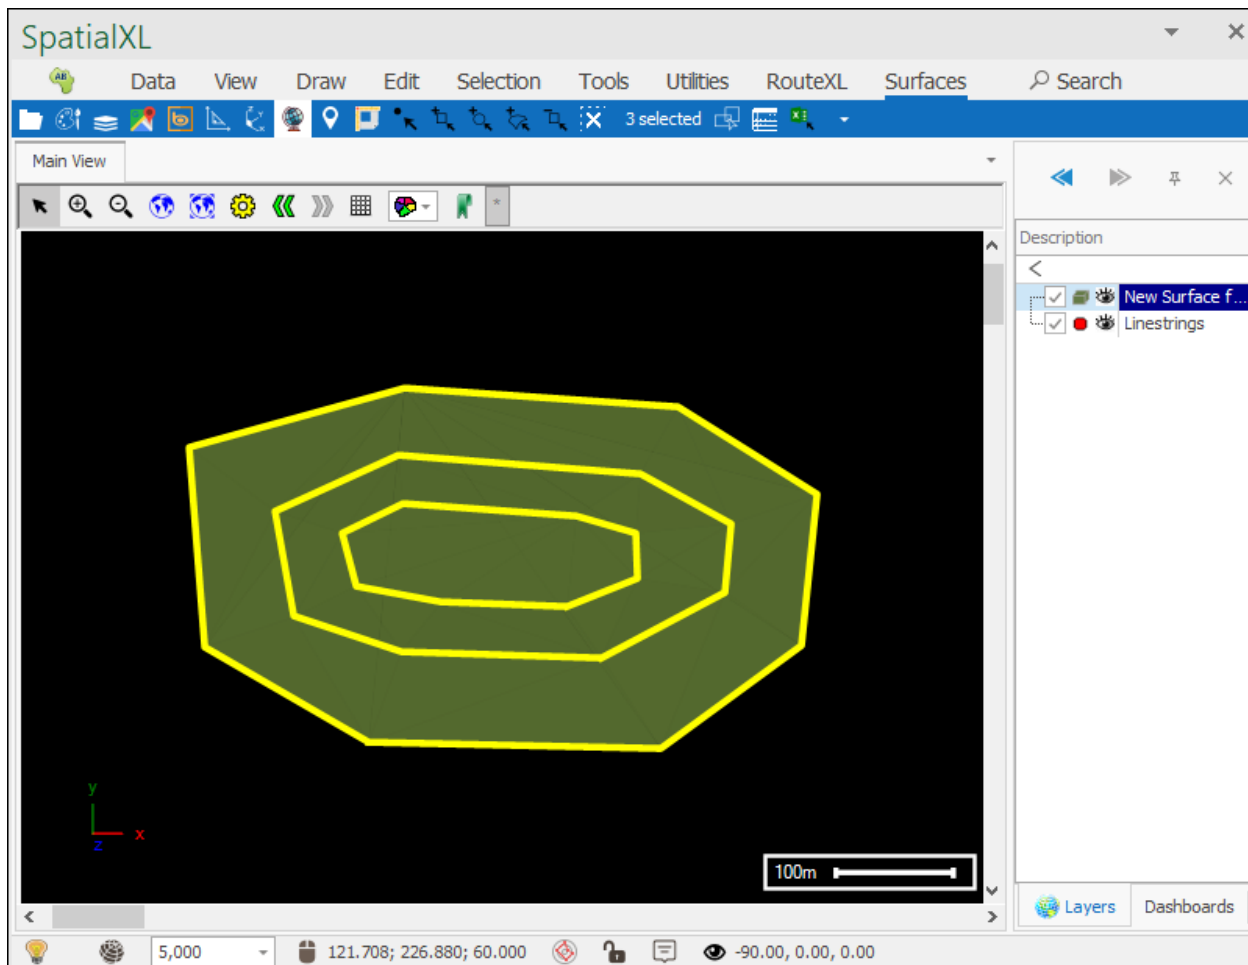

The next tool is the **Closed From linestrings** tool which will build a closed surface from selected linestrings:

Select the linestrings:

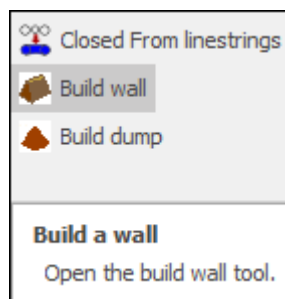

Then click **From Closed linestrings** and your surface will be created:

Build Wall

The next tool is the **Build wall** tool which allows you to create a wall with various parameters:

Clicking on it brings up the following dialogue:

Build Wall

Crest Elevation: 250.000 ☐ Draw Baseline

Minimum Height: 5.000

Baseline Height: 1.000

	X	Y	Z	Crest Width	Left Slope	Right Slope
▶						

Wall will be clipped by selected surface if any

Crest Elevation is the height of the top of your wall in meters:

Build Wall

Crest Elevation: 250.000 ☐ Draw Baseline

Minimum Height: 5.000

Baseline Height: 1.000

Minimum Height is the minimum height in meters that you set that the wall can go:

The 'Build Wall' dialog box is shown with a red close button in the top right corner. It contains three input fields: 'Crest Elevation' with a value of 250.000, 'Minimum Height' with a value of 5.000 (highlighted in yellow), and 'Baseline Height' with a value of 1.000. To the right of these fields is a checkbox labeled 'Draw Baseline' which is currently unchecked. Below the input fields are three buttons: 'Copy from selecte', 'Close Wall', and 'Create Wall'.

Baseline Height is the height in meters of the drawn baseline above the bottom of the wall; if it is set at zero then the wall will just start exactly at the baseline:

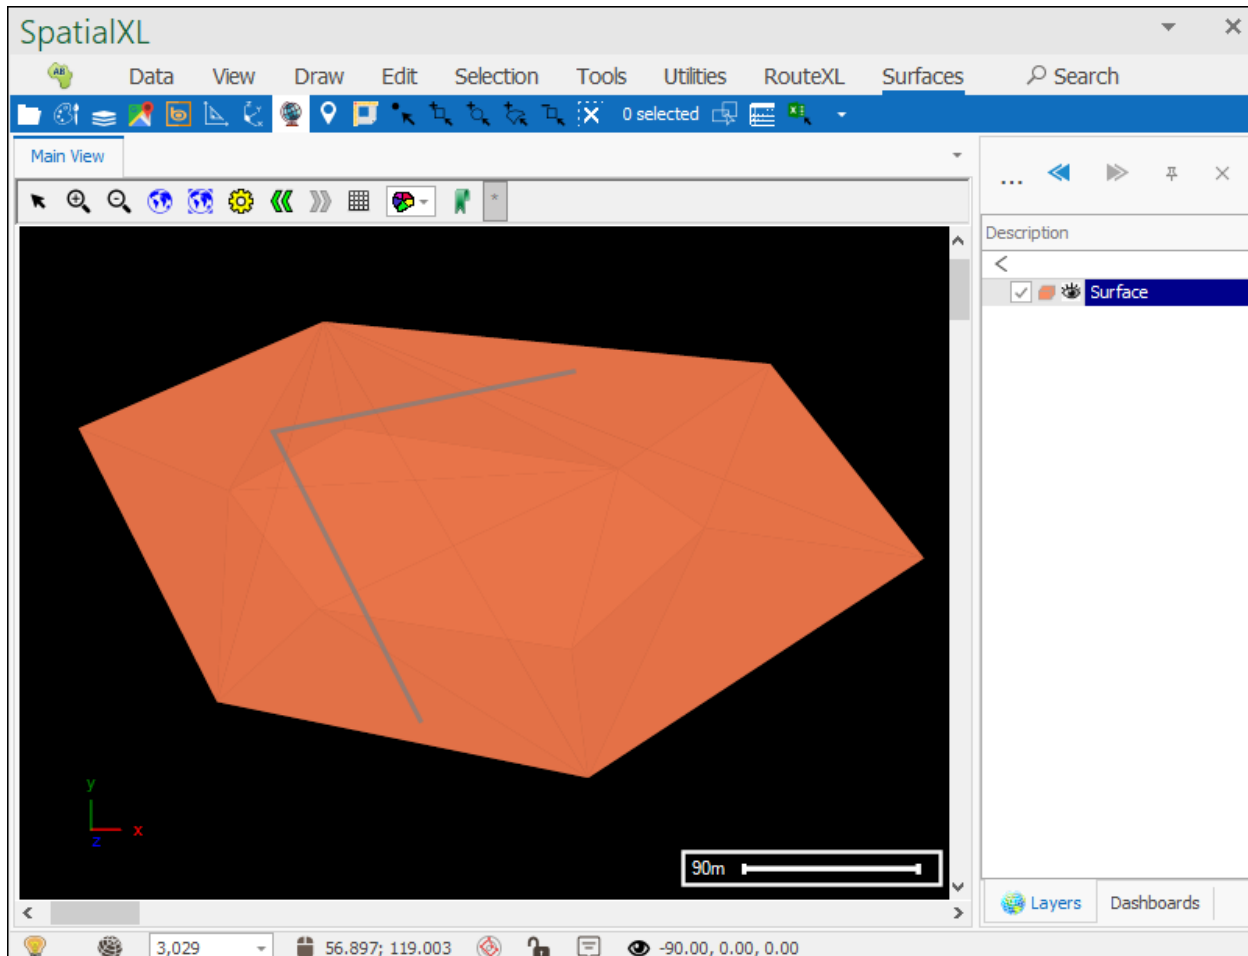

The 'Build Wall' dialog box is shown with the same settings as the previous screenshot. The 'Baseline Height' input field, which has a value of 1.000, is now highlighted in yellow. The 'Draw Baseline' checkbox remains unchecked.

To start drawing your baseline you can tick on **Draw Baseline** and then click in your scene to draw and double click to finish:

The 'Build Wall' dialog box is shown with the 'Draw Baseline' checkbox now checked and highlighted in yellow. The other settings remain the same: 'Crest Elevation' is 250.000, 'Minimum Height' is 5.000, and 'Baseline Height' is 1.000. The buttons 'Copy from selecte', 'Close Wall', and 'Create Wall' are still present.

The coordinates of your baseline are now in the grid below:

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

Close Wall

Create Wall

	X	Y	Z	Crest Width	Left Slope	Right Slope
▶	-22.438283...	-61.304596...	0	10	0	0
	-98.568175...	87.7497168...	0	10	0	0
	56.8970766...	119.003040...	0	10	0	0
	56.8970766...	119.003040...	0	10	0	0
	56.8970766...	119.003040...	0	10	0	0
✱						

Wall will be clipped by selected surface if any

And you can now set the **Crest Width**, **Left Slope** and **Right Slope** (the slopes are expressed in units of horizontal distance divided by height, so if you have a 4 meter high wall and choose 1 meter horizontal distance then this would be $1/4 = 0.25$ as your slope; smaller numbers means a steeper slope, bigger numbers will give you a more gradual slope):

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

Copy from select

Close Wall

Create Wall

	X	Y	Z	Crest Width	Left Slope	Right Slope
	-22.438283...	-61.304596...	0	15	0.1	0
	-98.568175...	87.7497168...	0	15	0.1	0
	56.8970766...	119.003040...	0	15	0.1	0
	56.8970766...	119.003040...	0	15	0.1	0
	56.8970766...	119.003040...	0	15	0.1	0

Wall will be clipped by selected surface if any

You can now click **Create Wall**, your wall will be drawn to any layer you have set as active, if you have none set as active then a new layer will be made for you and you will be prompted to choose the projection:

Choose layer projection

The data to load has no projection associated with it.
Please choose a projection for the data.

World_Mercator

SRID: 31466

☐ Well known text

Use scene projection

Use selected projection

Your wall has now been created and you can rotate it around to inspect it:

If you want your wall to be closed you would click **Close Wall** which will add extra geometries in the grid(for the closing of the wall):

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

Close Wall

Create Wall

	X	Y	Z	Crest Width	Left Slope	Right Slope
	-55.29434...	-34.05810...	0	15	0.1	0
	-127.4173...	38.064945...	0	15	0.1	0
	-59.30117...	112.59210...	0	15	0.1	0
	59.378143...	92.318595...	0	15	0.1	0
	104.97911...	18.030763...	0	15	0.1	0
	36.189401...	-43.13420...	0	15	0.1	0
	36.189401...	-43.13420...	0	15	0.1	0
▶	36.189401...	-43.13420...	0	15	0.1	0
	-55.29434...	-34.05810...	0	15	0.1	0

Wall will be clipped by selected surface if any

Then you would click **Create Wall** and a closed wall will have been created for you:

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

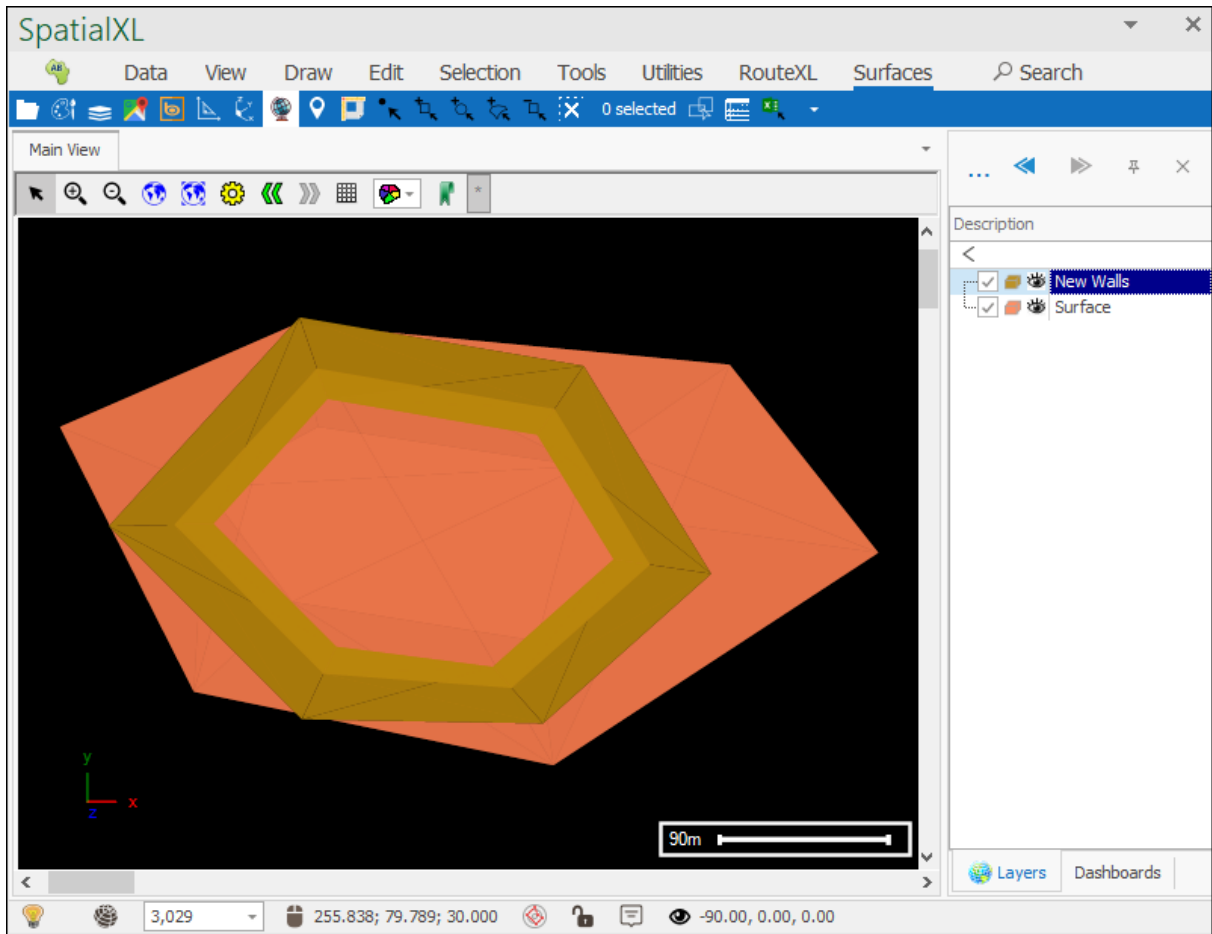

Copy from selecte

Close Wall

Create Wall

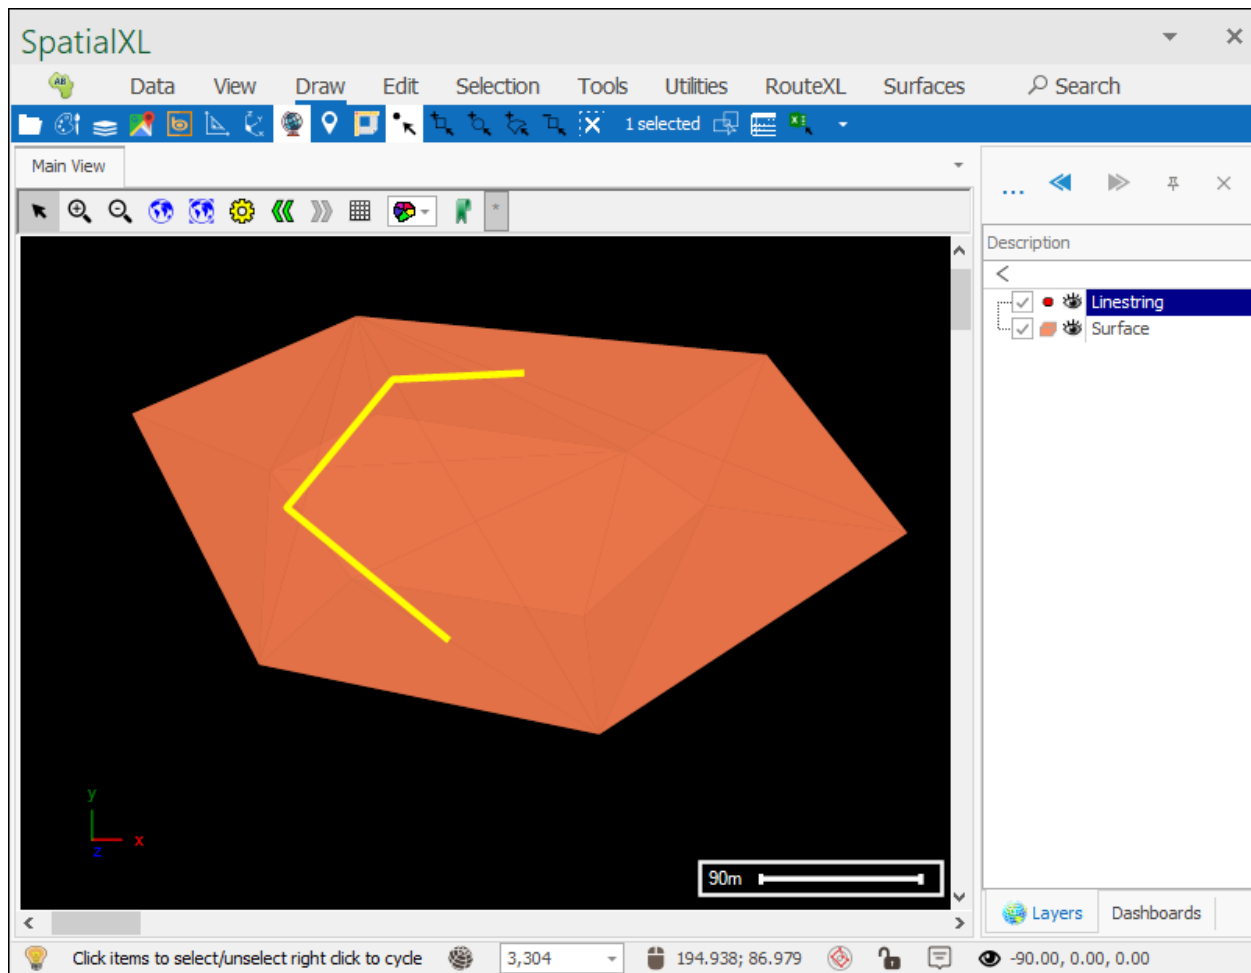

X	Y	Z	Crest Width	Left Slope	Right Slope
-55.29434...	-34.05810...	0	15	0.1	0
-127.4173...	38.064945...	0	15	0.1	0
-59.30117...	112.59210...	0	15	0.1	0
59.378143...	92.318595...	0	15	0.1	0
104.97911...	18.030763...	0	15	0.1	0
36.189401...	-43.13420...	0	15	0.1	0
36.189401...	-43.13420...	0	15	0.1	0
36.189401...	-43.13420...	0	15	0.1	0
-55.29434...	-34.05810...	0	15	0.1	0

Wall will be clipped by selected surface if any

When creating your baseline you don't have to use the **Draw Baseline** option, if you have a linestring layer already in your scene that you would like to use as the baseline then simply select the linestring and then click **Copy from Selected** and the geometries will be pasted in:

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

Copy from selected

Close Wall

Create Wall

	X	Y	Z	Crest Width	Left Slope	Right Slope

	-111.89277...	37.1518994...	0	10	0	0
	-51.706945...	108.025116...	0	10	0	0
	19.2315714...	112.329860...	0	10	0	0
✱						

Wall will be clipped by selected surface if any

One last point is that if you are creating your wall on an already existing surface then you can choose to have the wall clipped by that surface if you want by selecting the surface before creating the wall:

Build Wall

Crest Elevation: 250.000

Minimum Height: 5.000

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

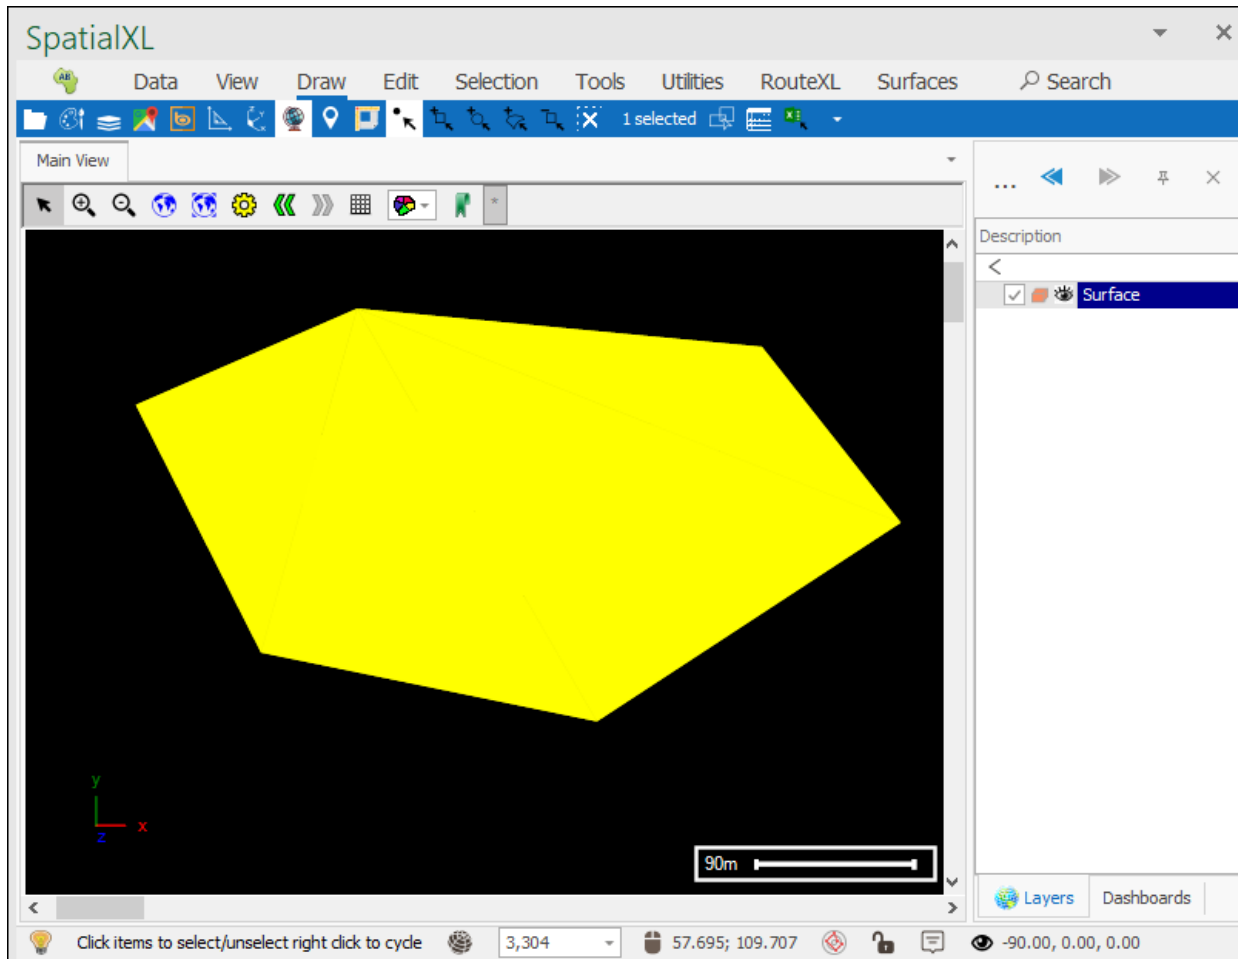

Close Wall

Create Wall

	X	Y	Z	Crest Width	Left Slope	Right Slope
▶	-20.539133...	-37.320839...	18.1311099...	10	0	0
	-111.89277...	37.1518994...	0	10	0	0
	-51.706945...	108.025116...	0	10	0	0
	19.2315714...	112.329860...	0	10	0	0
✱						

Wall will be clipped by selected surface if any

←

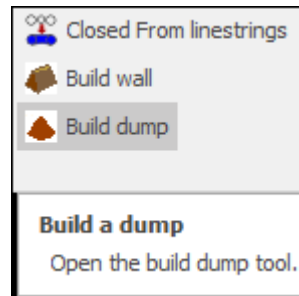

And as you can see the wall has been clipped by the surface.

Build Dump

The next tool is the **Build dump** tool which allows you to create a dump with various parameters:

Clicking on it brings up the following dialogue:

Build Dump ✕

Crest Elevation: ☐ Draw Baseline

Slope: Copy from selecte

Baseline Height: Create Dum

	X	Y	Z
✶			

Dump will be clipped by selected surface if any

Crest Elevation is the height of the top of your dump in meters:

Build Dump

Crest Elevation: 100.000

Slope: 0.010

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

Create Dum

You can then specify the **Slope** for the dump (the slope is expressed in units of horizontal distance divided by height, so if you have a 4 meter high dump and choose 1 meter horizontal distance then this would be $1/4 = 0.25$ as your slope; smaller numbers means a steeper slope, bigger numbers will give you a more gradual slope):

Build Dump

Crest Elevation: 100.000

Slope: 0.010

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

Create Dum

Baseline Height is the height in meters of the drawn baseline above the bottom of the dump; if it is set at zero then the dump will just start exactly at the baseline:

Build Dump

Crest Elevation: 100.000

Slope: 0.010

Baseline Height: 1.000

☐ Draw Baseline

Copy from selecte

Create Dum

To start drawing your baseline you can tick on **Draw Baseline** and then click in your scene to draw and double click to finish:

Build Dump ✕

Crest Elevation:

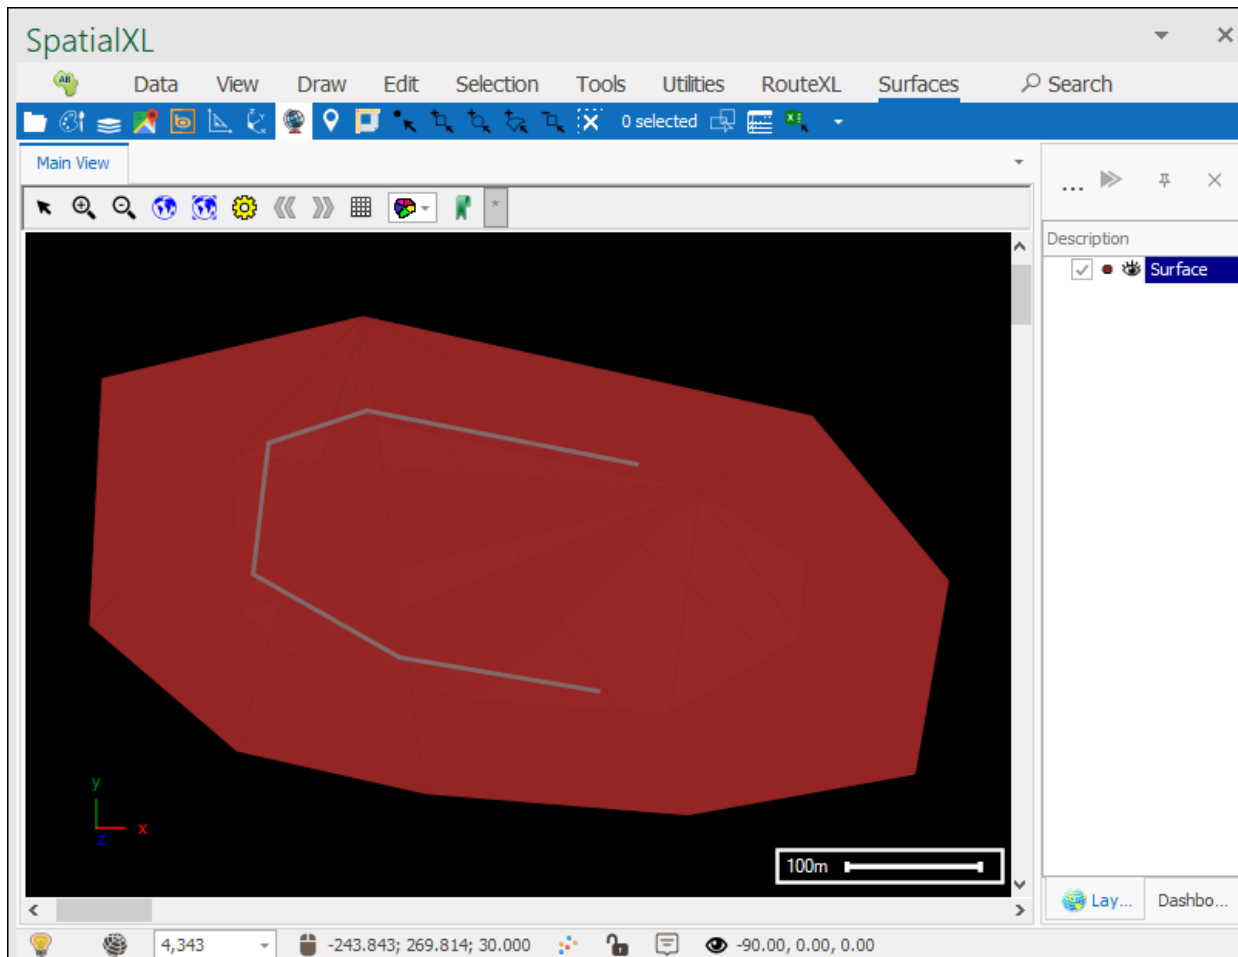

Slope:

Dump will be clipped by selected surface if any

And as you can see the wall has been clipped by the surface.

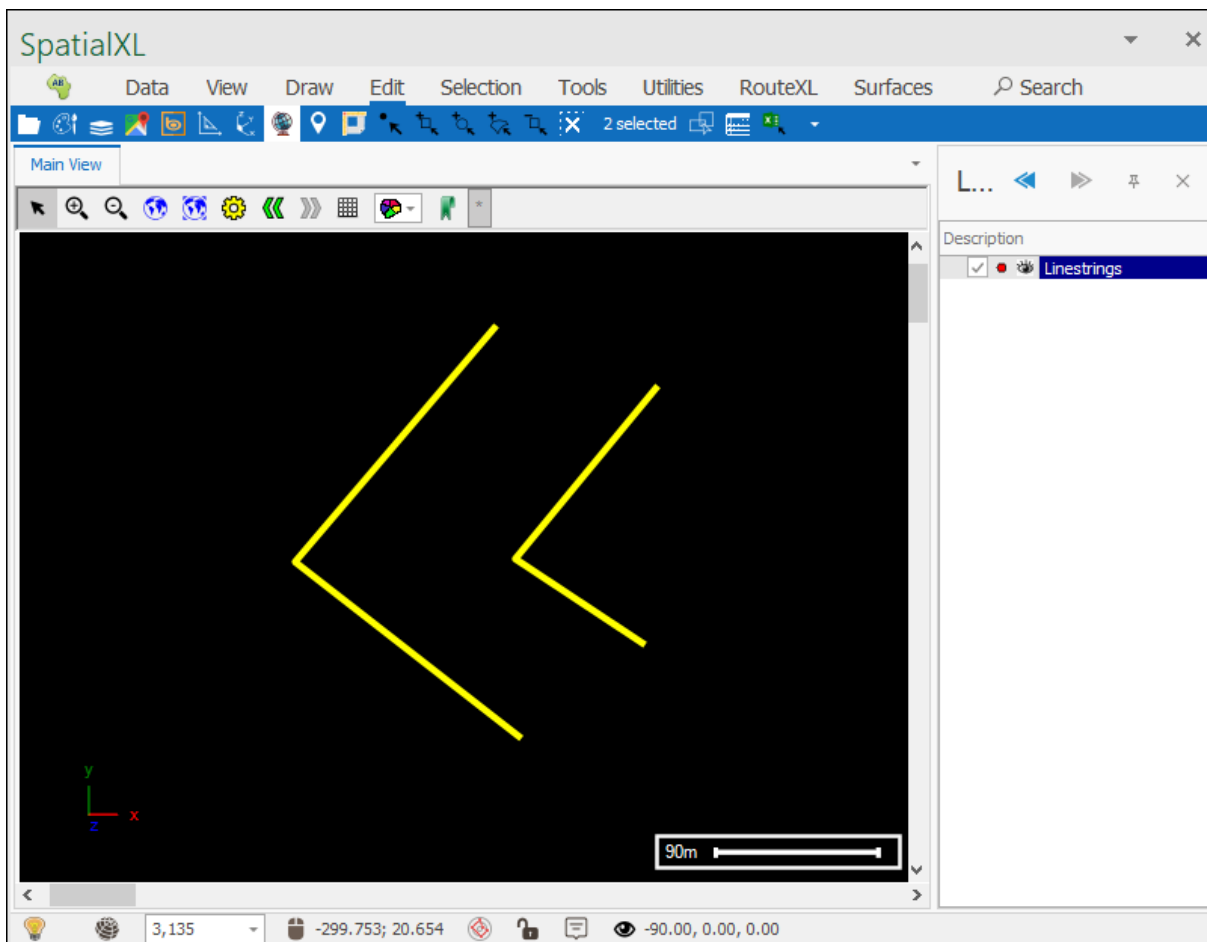

Build surface between strings

The next tool is the **Build surface between strings** tool which is seen as the first little icon here:

This tool allows you to build a surface between a pair of linestrings.

First select your linestrings:

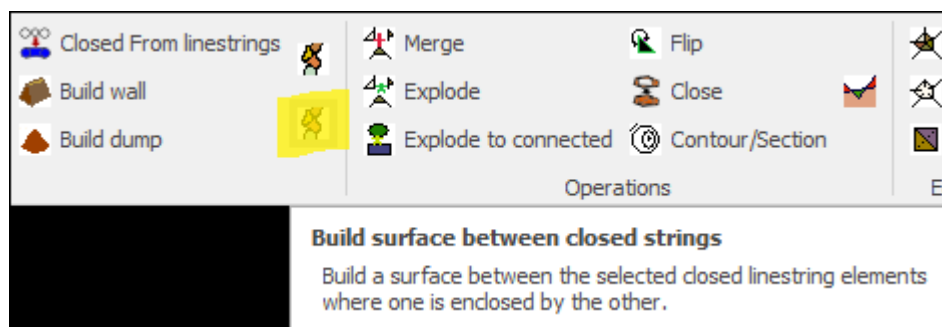

Then click the **Build surface between strings** tool and your surface will be created:

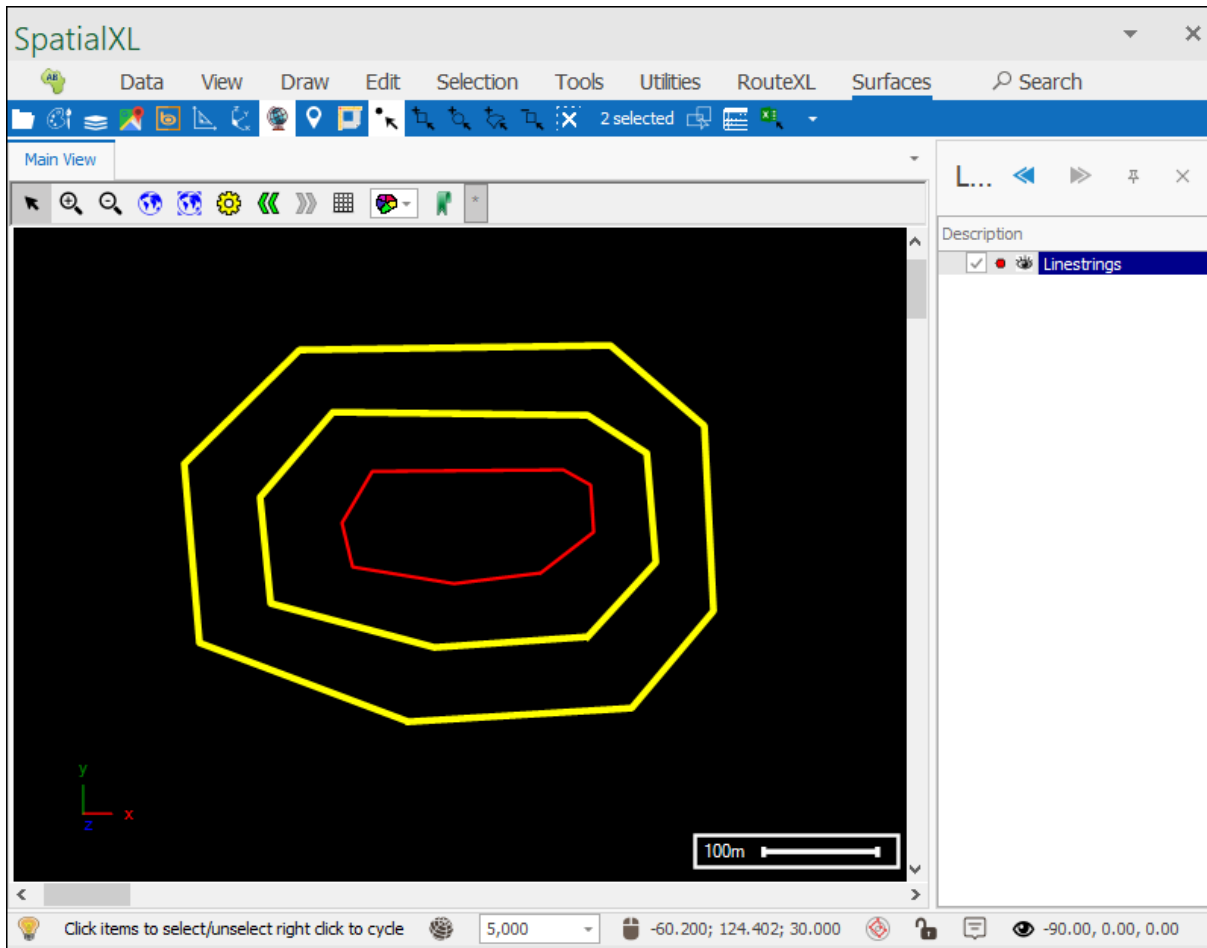

Build surface between closed strings

The next tool is the **Build surface between closed strings** tool which is seen as the second little icon here:

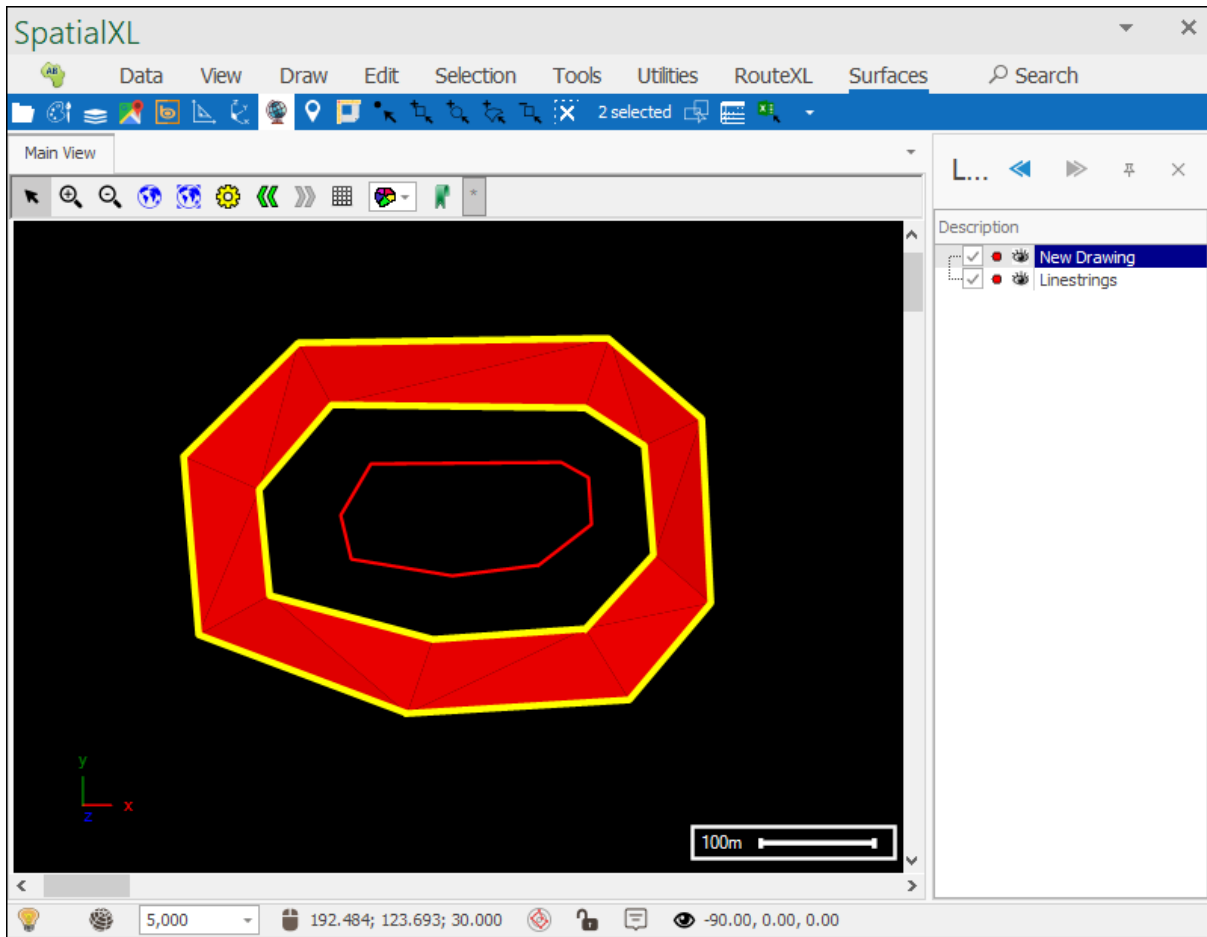

This tool will build a surface between a pair of selected closed linestring elements where one is enclosed by the other.

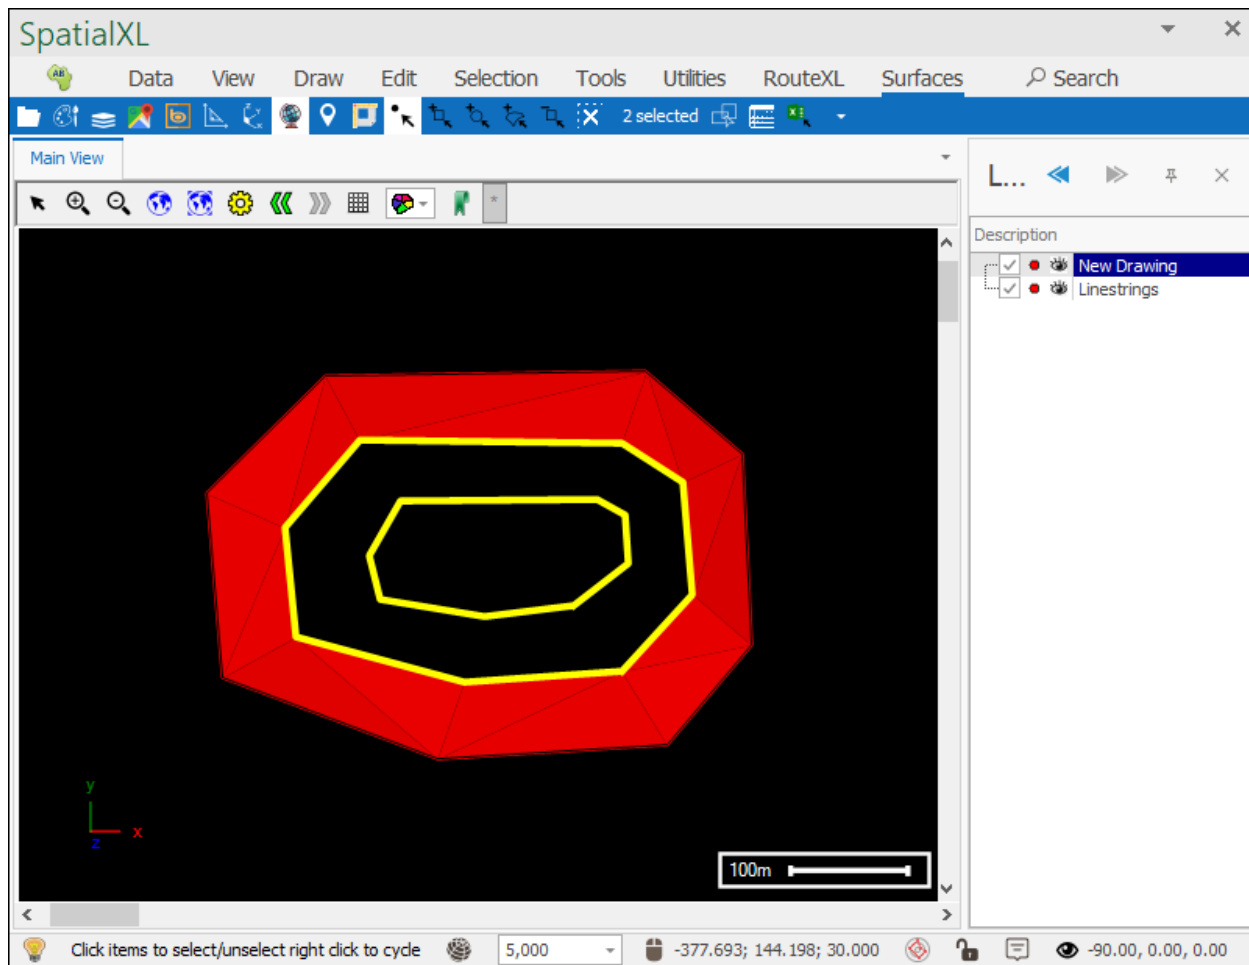

First select the linestrings:

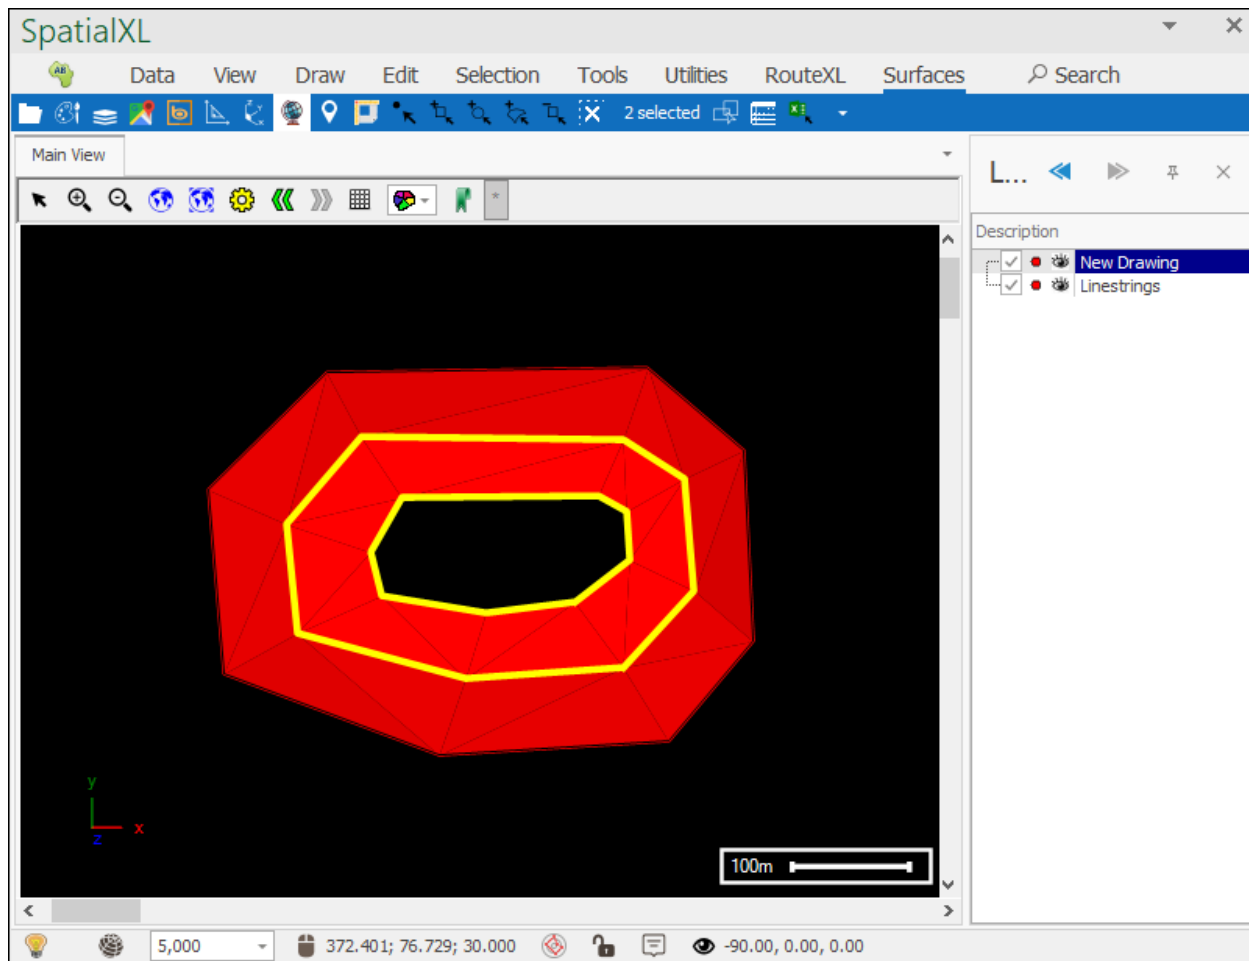

Then click the **Build surface between closed strings** tool and your surface will be created:

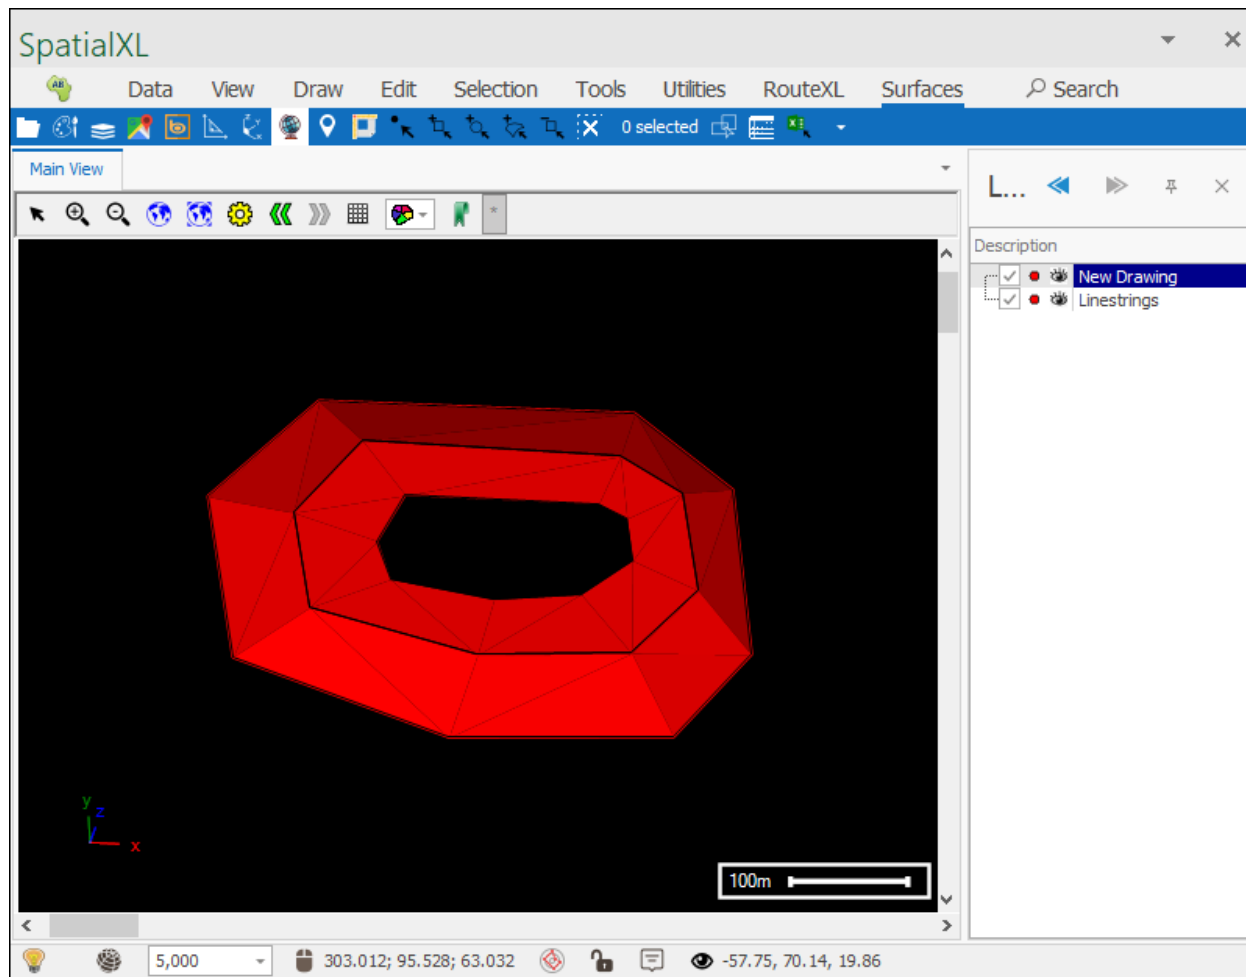

I can the select the next two closed linestrings:

And click the **Build surface between closed strings** tool to build the next surface:

These last two tools are useful for creating surfaces where if you just used the **From linestrings** tool the surface might not be created so accurately. Here you can step by step create each part of the surface by only making a surface between two closed linestrings at a time.

Operations

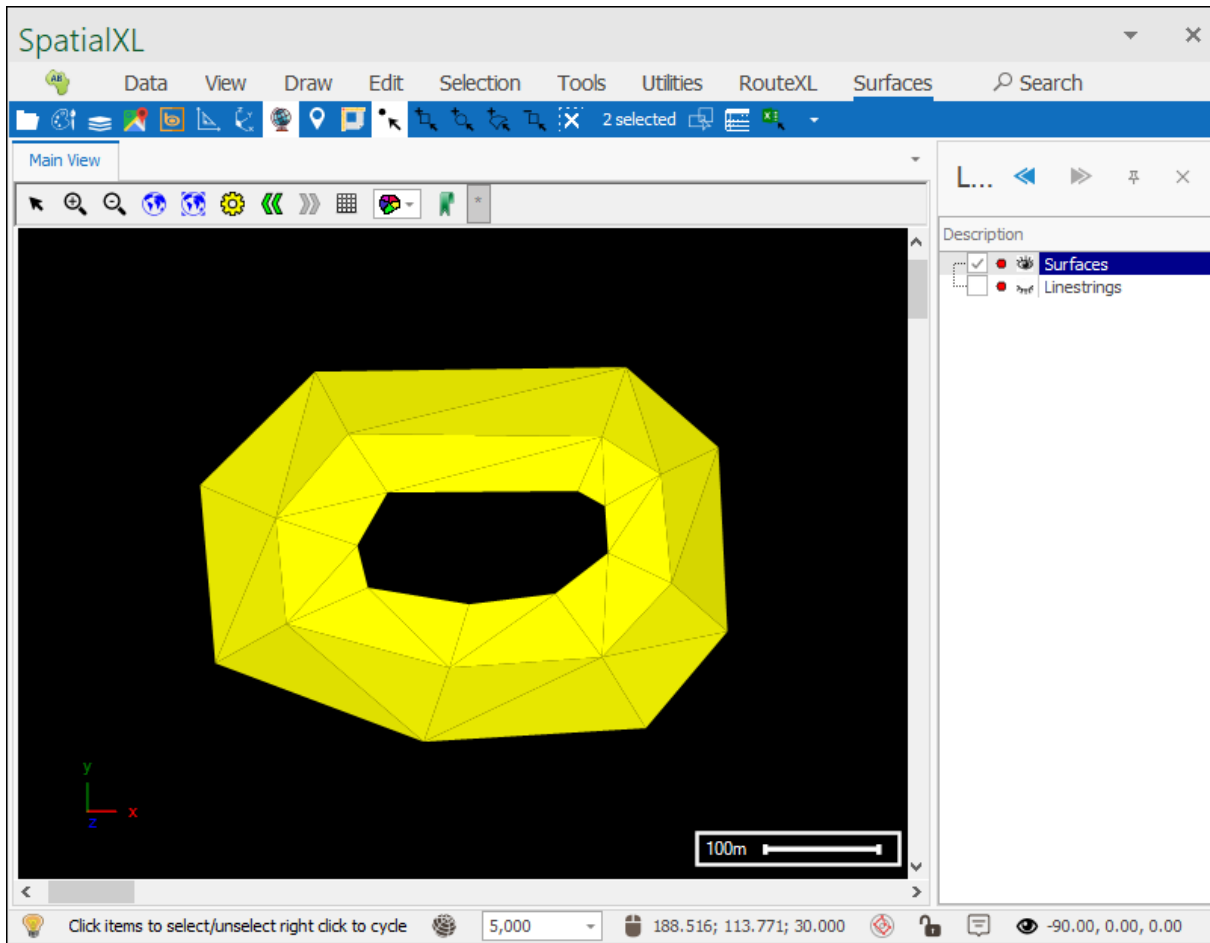

Merge

The first tool in the Operations section of the Surfaces tab is the **Merge** tool which allows you to merge selected surfaces together:

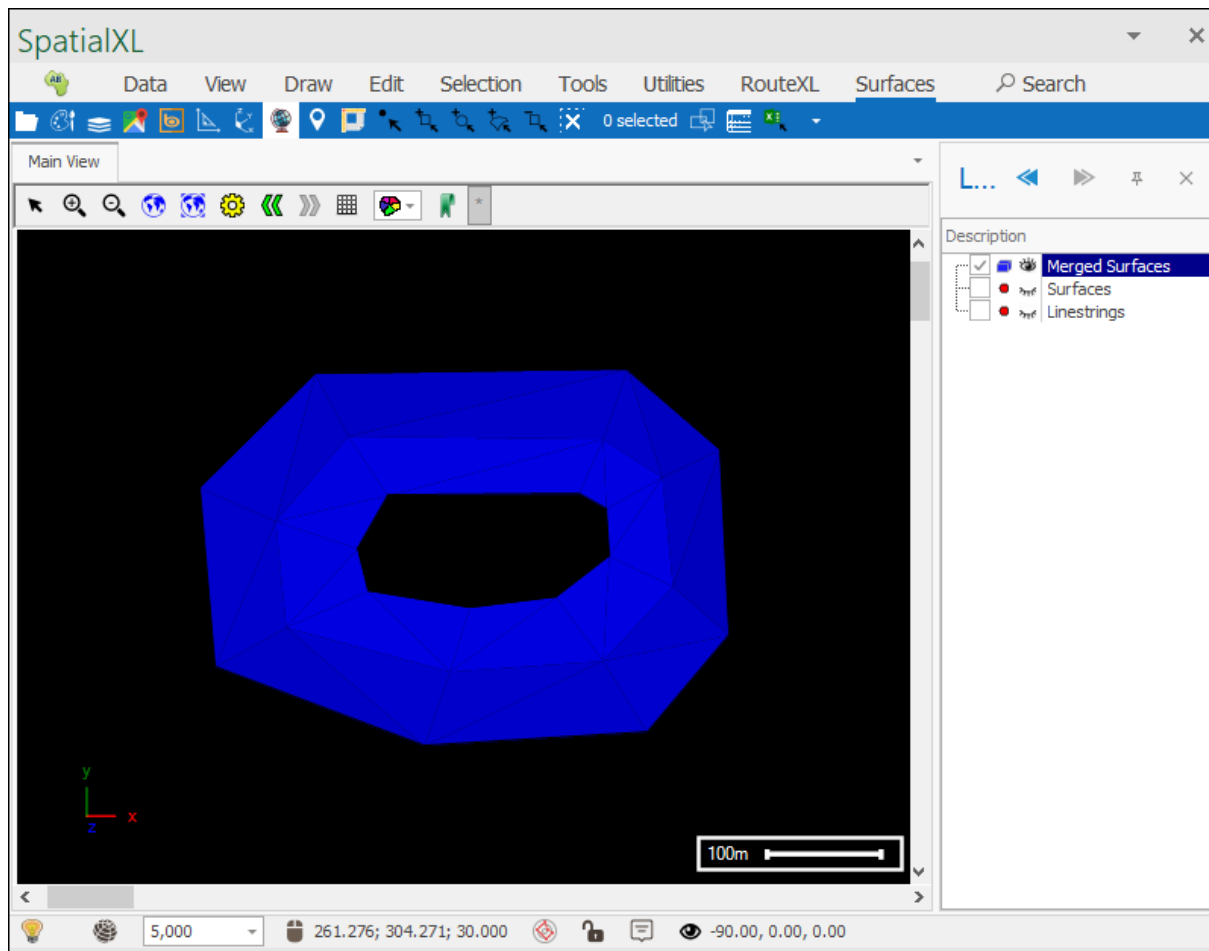

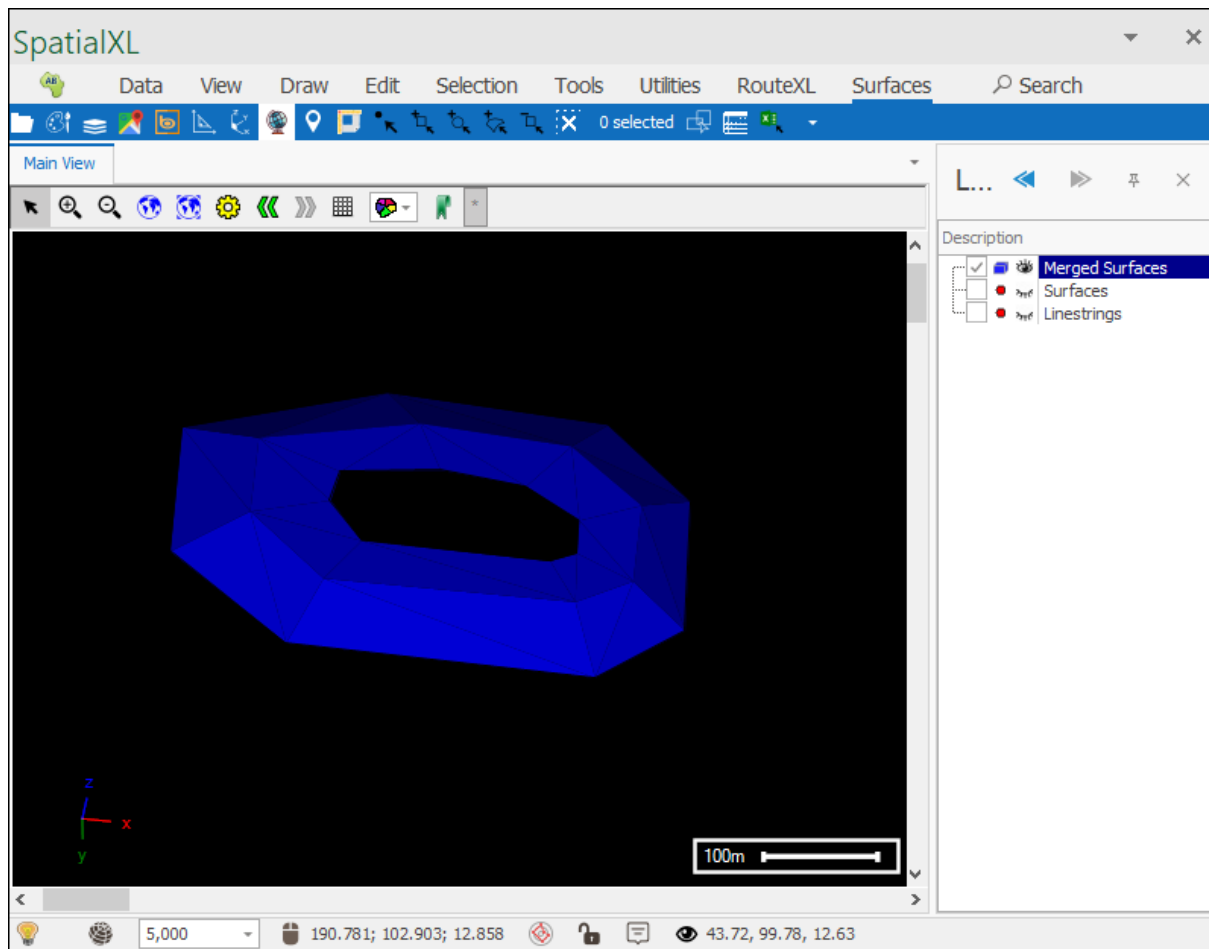

First select your surfaces:

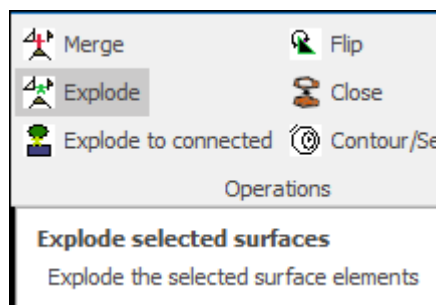

Then click **Merge** and your surfaces will have been merged:

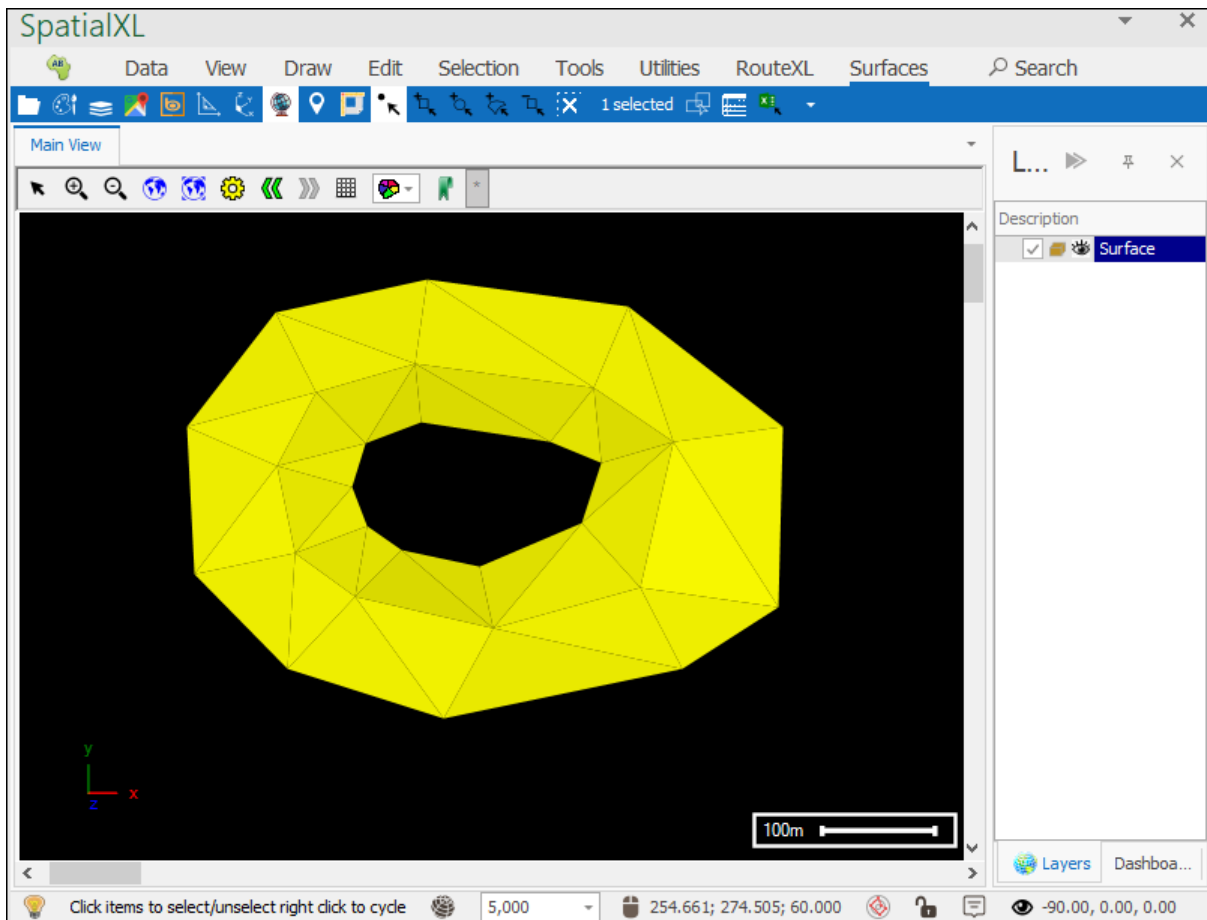

Explode

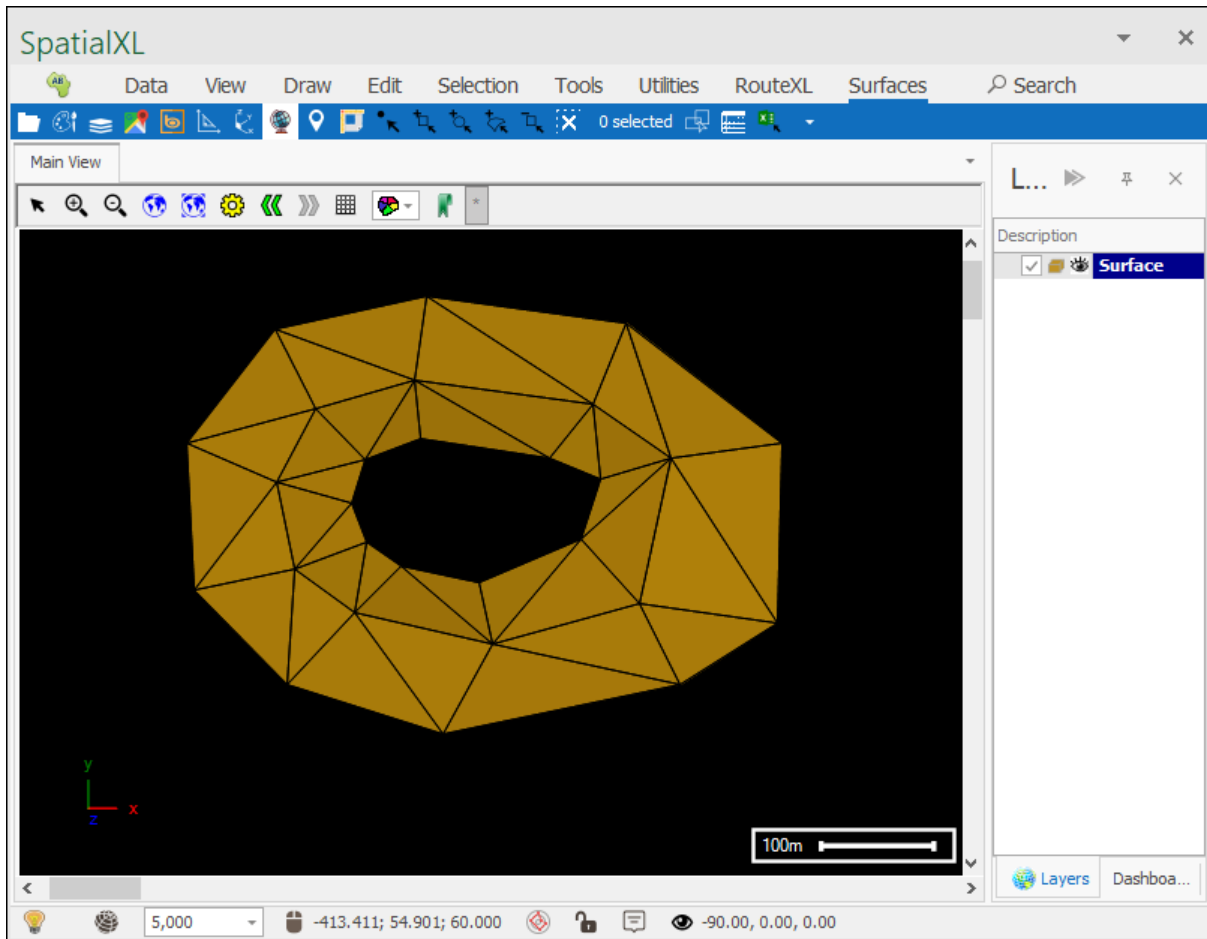

The next tool is the **Explode** tool which will separate each facet of a surface into its own separate surface:

Select the surface you want to explode:

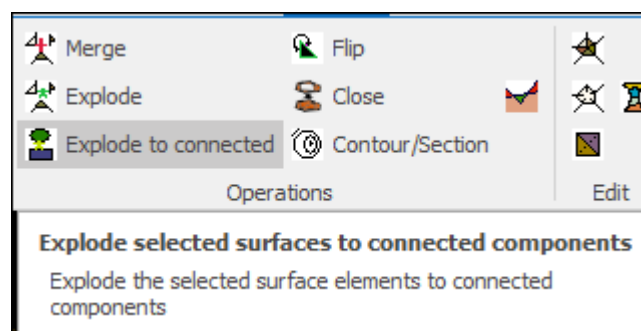

Then click the **Explode** tool and your surface will have been exploded:

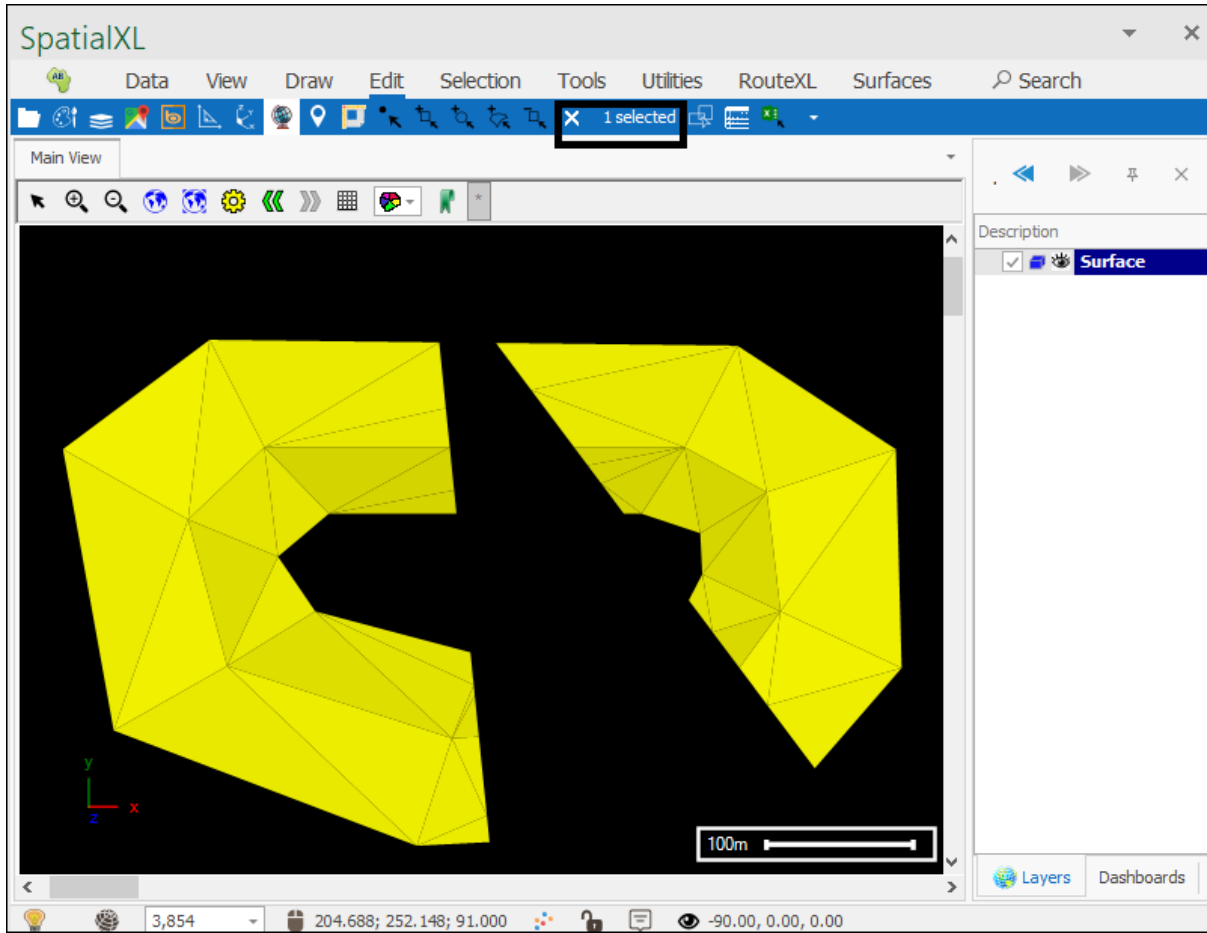

Explode to connected

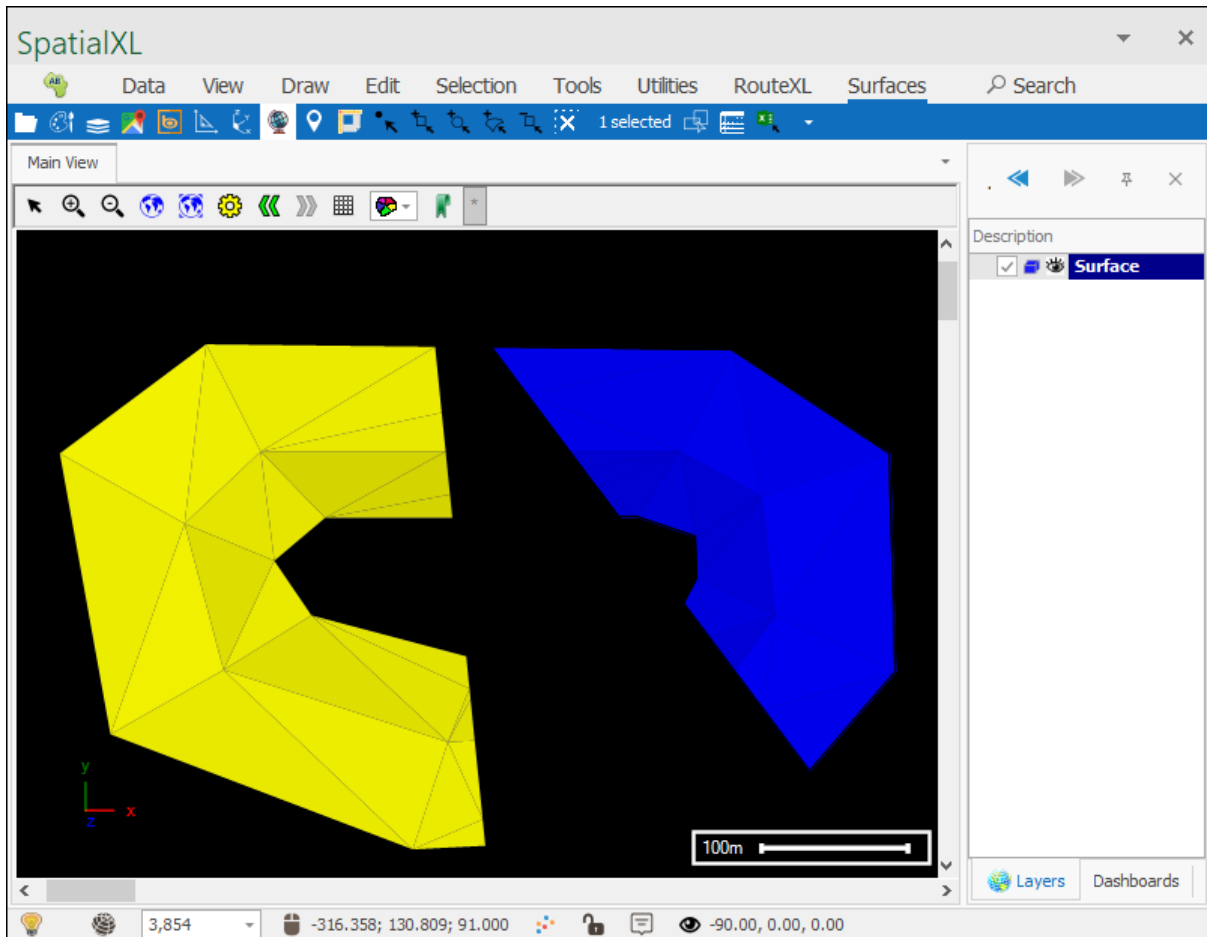

The next tool is the **Explode to connected** tool which will separate the parts of a surface, that are not physically touching in space but which are connected and form one surface, into separate surfaces:

First select the surface:

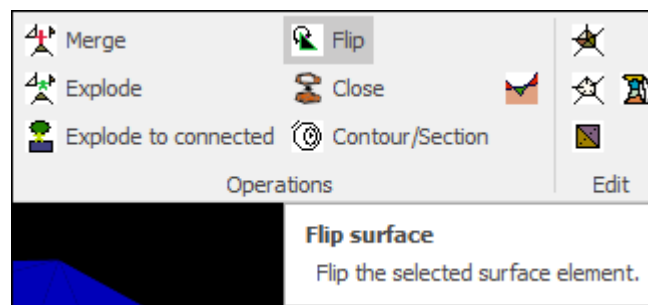

Then select the **Explode to connected** tool and the components will have been separated into two different surfaces:

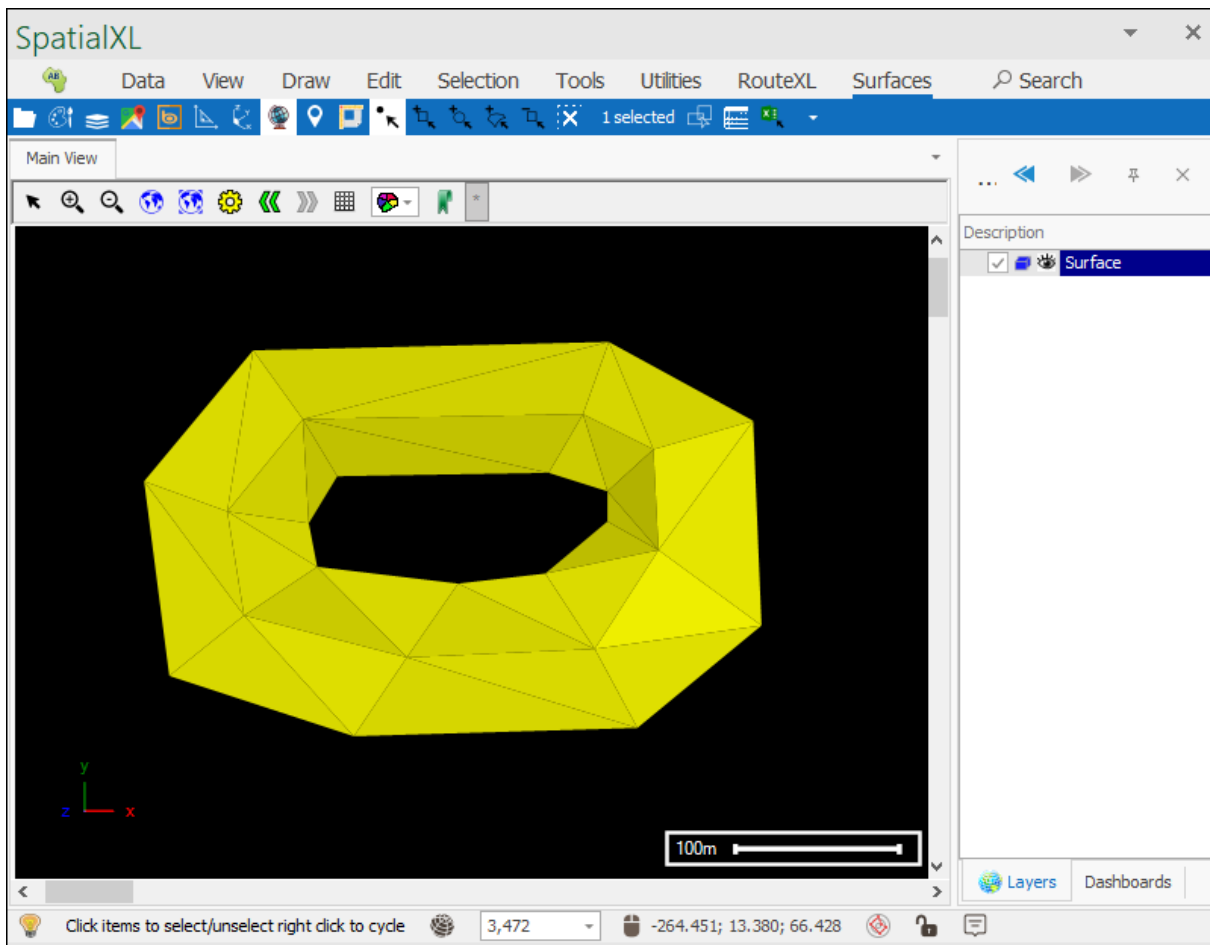

Flip

The next tool is the **Flip** tool which will flip the orientation of facets of a surface so that the surface can be exported to another system or so that it can merge with another surface:

First select the surface:

Then click the **Flip** tool and your surface facets will have been flipped in orientation (**Note:** this is not a change you would physically see but it does occur):

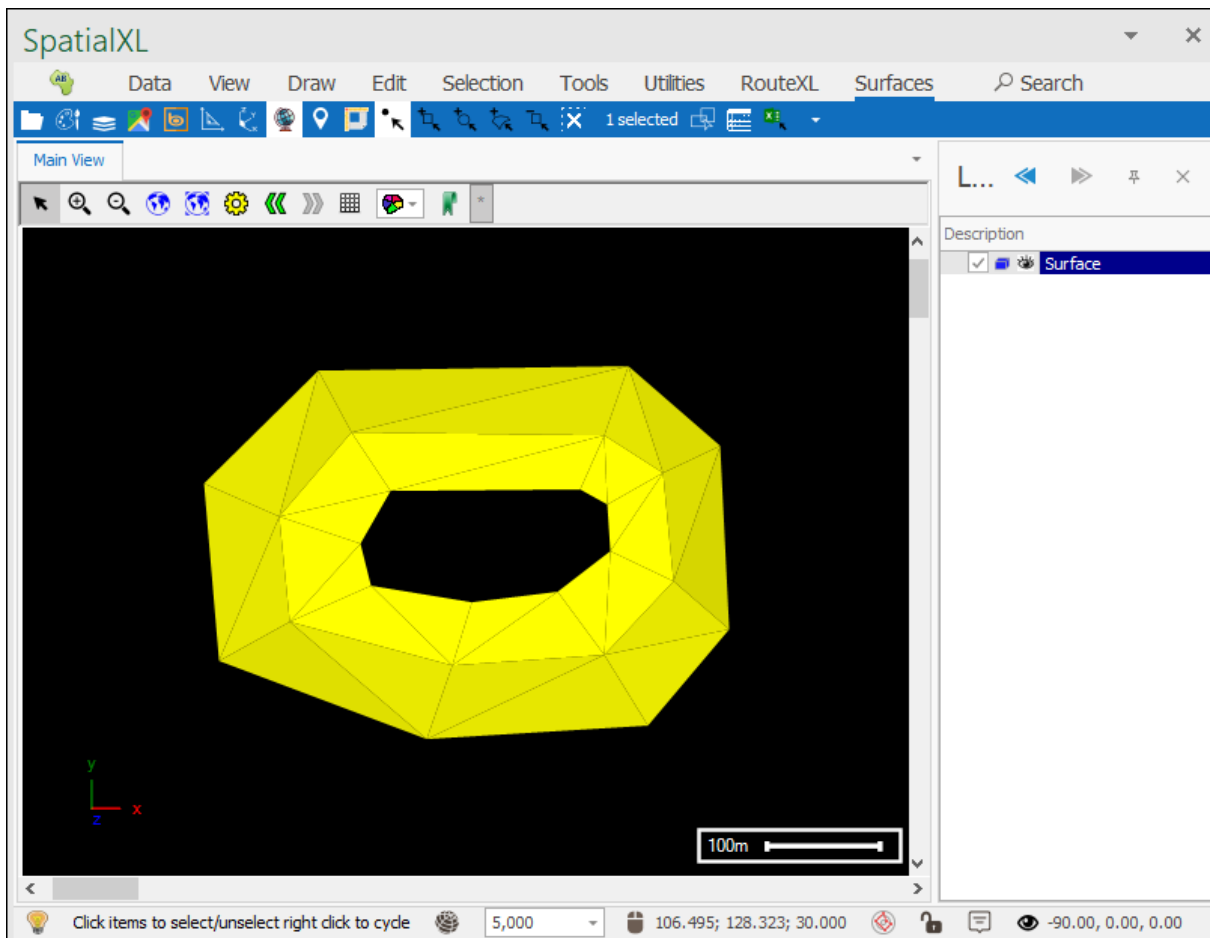

Close

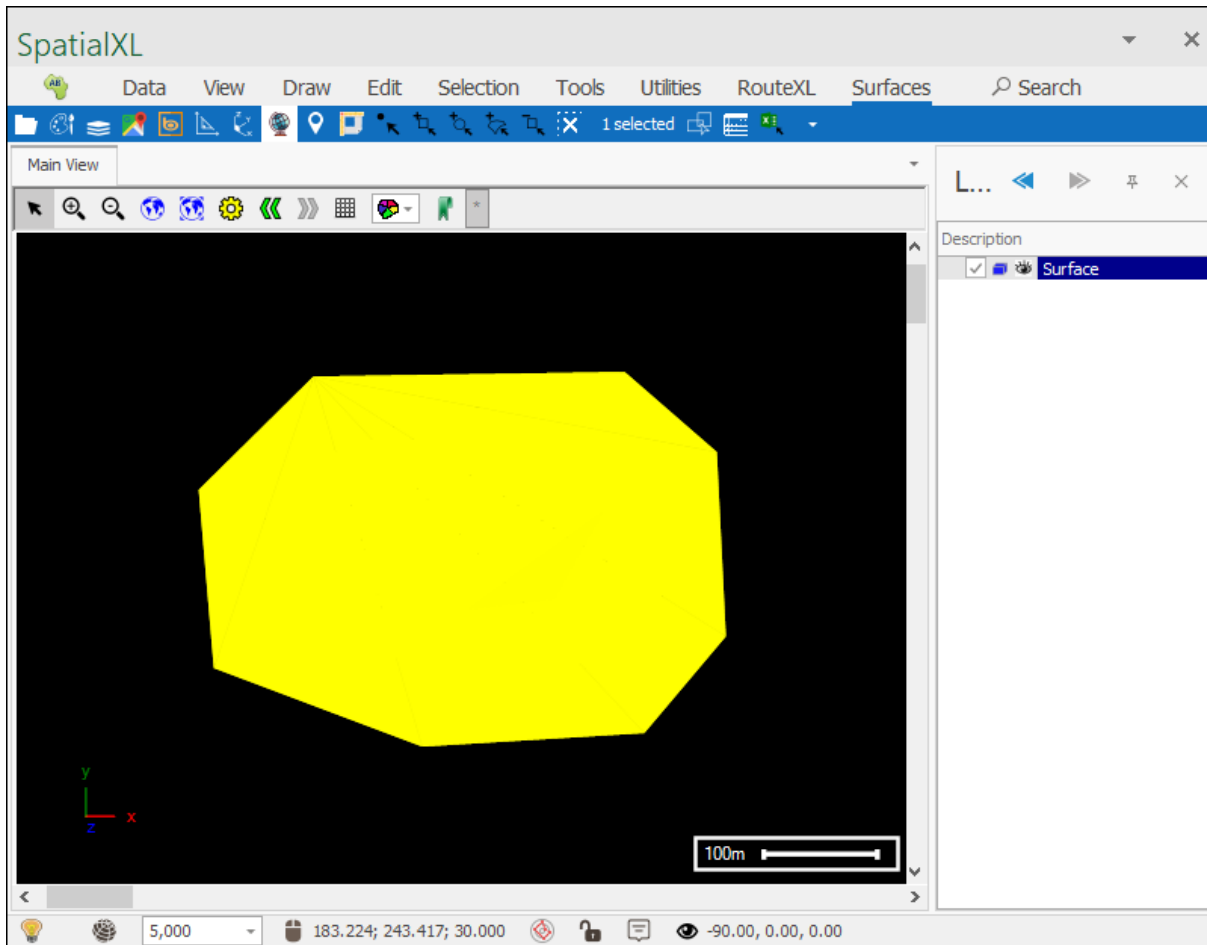

The next tool is the **Close** tool which will close a selected surface:

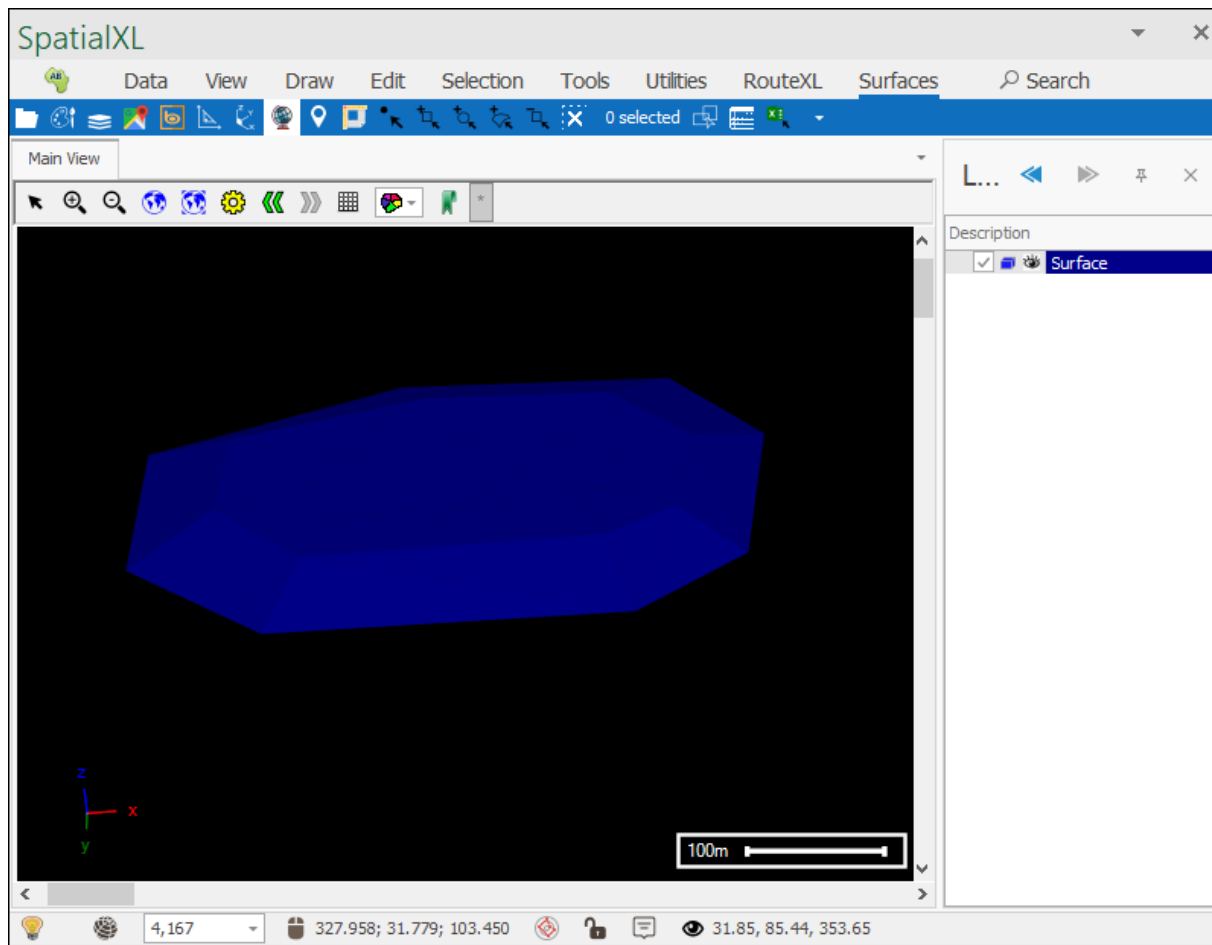

First select the surface:

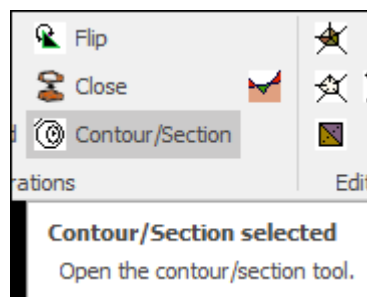

Then click **Close** and your surface will be closed:

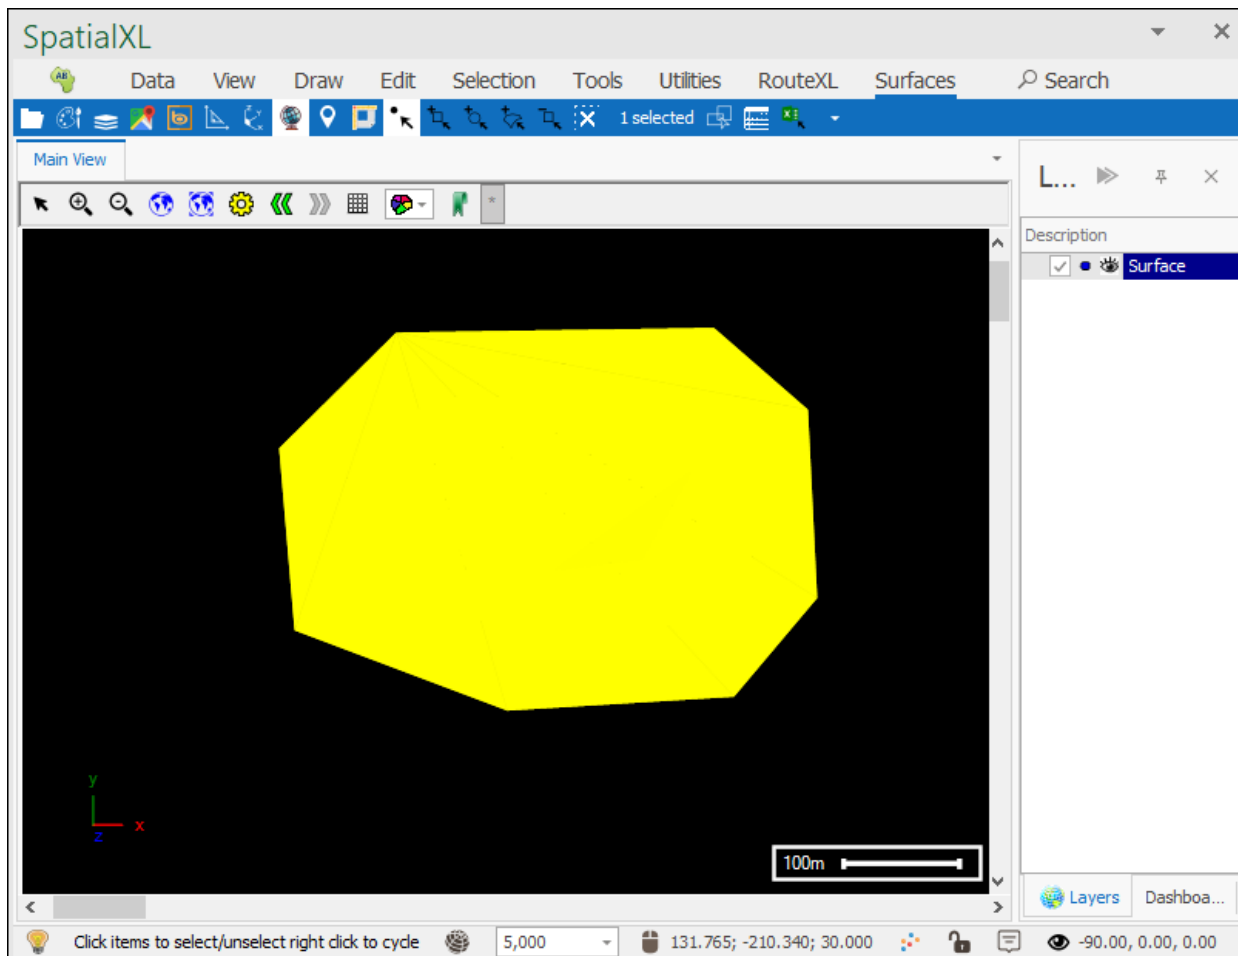

Contour/Section

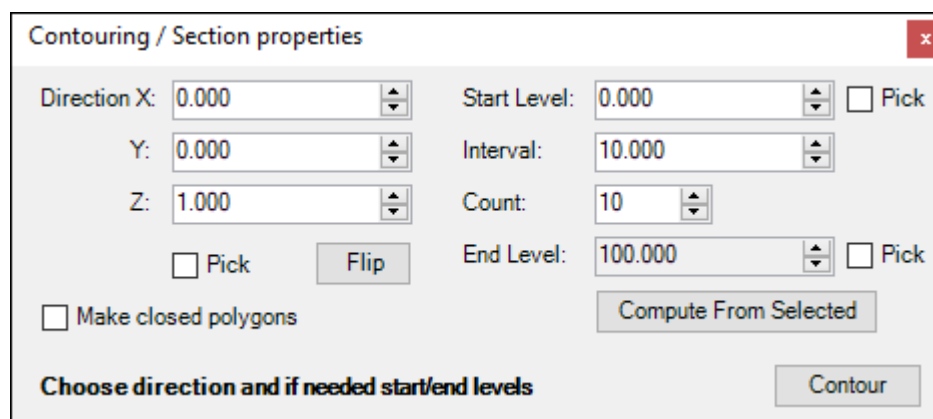

The next tool is the **Contour/Section** tool which allows you to create contours/sections for any surface:

First select your surface:

Then open the tool which will bring up the following dialogue:

First you can choose the direction of the contours/sections (in this example I will leave it at the default):

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☐ Pick

Y: 0.000 Interval: 10.000

Z: 1.000 Count: 10

☐ Pick Flip End Level: 100.000 ☐ Pick

☐ Make closed polygons Compute From Selected

Choose direction and if needed start/end levels Contour

Optionally you can tick on the **Pick** box and click in your scene to choose your directions:

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☐ Pick

Y: 0.000 Interval: 10.000

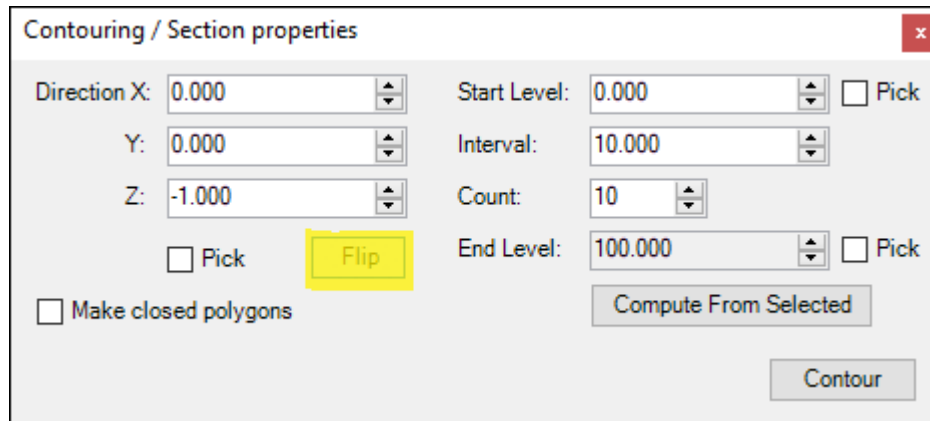

Z: 1.000 Count: 10

☒ Pick Flip End Level: 100.000 ☐ Pick

☐ Make closed polygons Compute From Selected

Click on first direction point in scene Contour

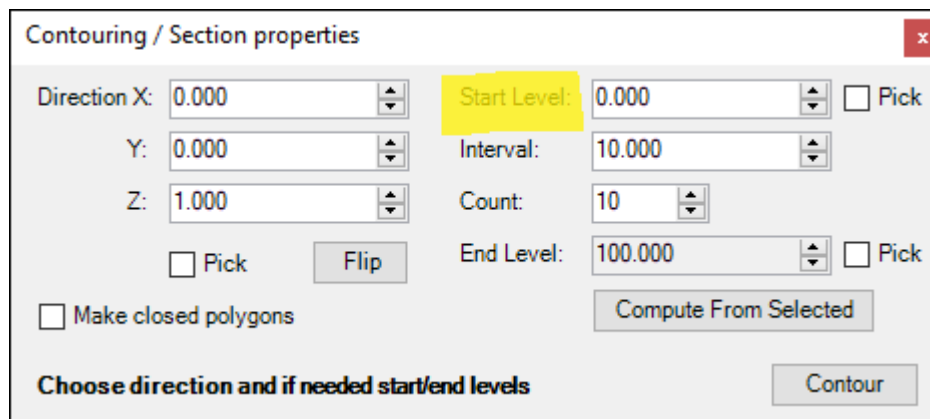

Clicking the **Flip** button will reverse the directions:

The screenshot shows the 'Contouring / Section properties' dialog box. It contains several input fields and buttons. The 'Flip' button is highlighted in yellow. The 'Start Level' field is set to 0.000, and the 'End Level' field is set to 100.000. The 'Interval' field is set to 10.000, and the 'Count' field is set to 10. The 'Direction X' field is set to 0.000, the 'Y' field is set to 0.000, and the 'Z' field is set to -1.000. There are checkboxes for 'Pick' and 'Make closed polygons'. A 'Compute From Selected' button is also present.

Property	Value	Action
Direction X	0.000	Spin box
Y	0.000	Spin box
Z	-1.000	Spin box
Start Level	0.000	Spin box
Interval	10.000	Spin box
Count	10	Spin box
End Level	100.000	Spin box
Flip	Button	Highlighted
Pick	Checkbox	Unchecked
Make closed polygons	Checkbox	Unchecked
Compute From Selected	Button	Available
Contour	Button	Available

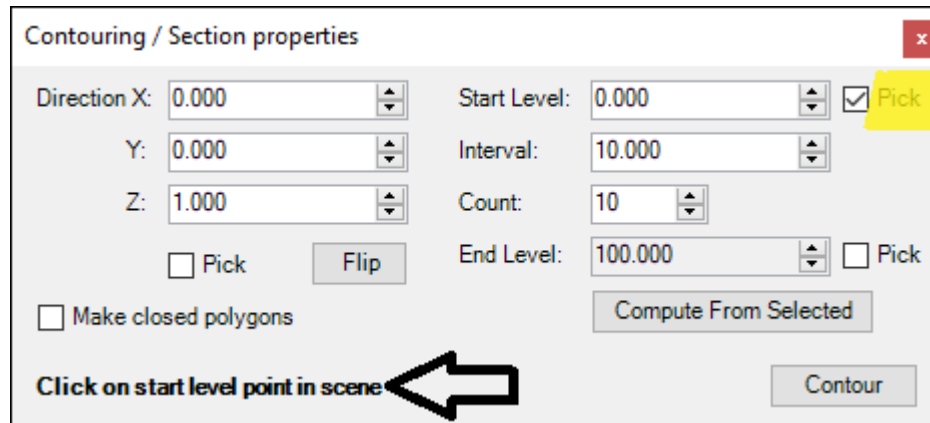

Next you can choose the level at which you would like the contours/sections to start:

The screenshot shows the 'Contouring / Section properties' dialog box. The 'Start Level' field is highlighted in yellow. The 'Z' field is now set to 1.000. The 'Flip' button is no longer highlighted. The 'Start Level' field is set to 0.000, and the 'End Level' field is set to 100.000. The 'Interval' field is set to 10.000, and the 'Count' field is set to 10. The 'Direction X' field is set to 0.000, the 'Y' field is set to 0.000, and the 'Z' field is set to 1.000. There are checkboxes for 'Pick' and 'Make closed polygons'. A 'Compute From Selected' button is also present.

Property	Value	Action
Direction X	0.000	Spin box
Y	0.000	Spin box
Z	1.000	Spin box
Start Level	0.000	Spin box
Interval	10.000	Spin box
Count	10	Spin box
End Level	100.000	Spin box
Flip	Button	Available
Pick	Checkbox	Unchecked
Make closed polygons	Checkbox	Unchecked
Compute From Selected	Button	Available
Contour	Button	Available

Optionally you can tick on the **Pick** box and then click in your scene to choose the **Start Level**:

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☒ Pick

Y: 0.000 Interval: 10.000

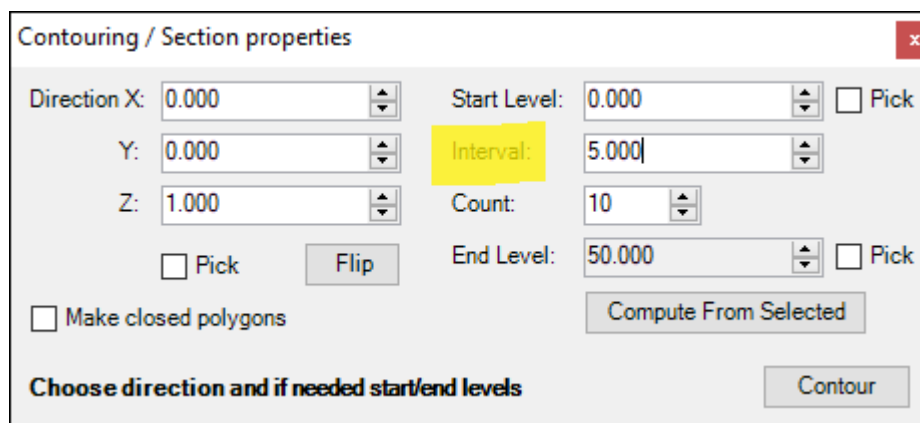

Z: 1.000 Count: 10

☐ Pick Flip End Level: 100.000 ☐ Pick

☐ Make closed polygons Compute From Selected

Click on start level point in scene Contour

Then choose how much of an interval you would like between each contour/section:

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☐ Pick

Y: 0.000 Interval: 5.000

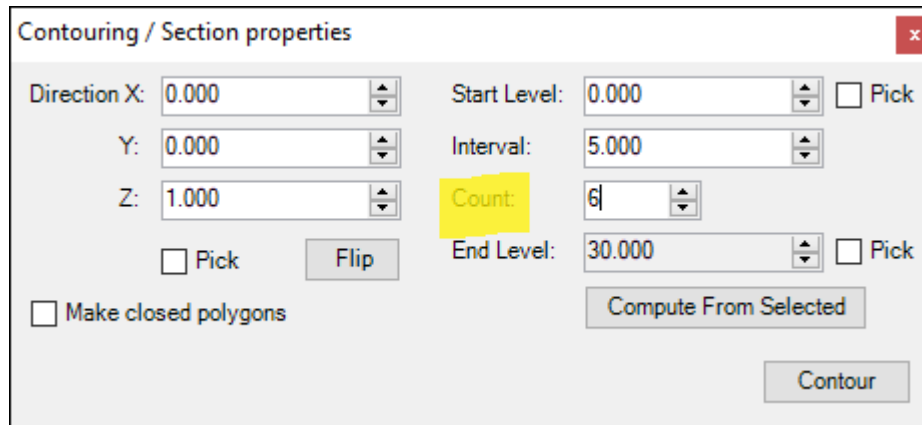

Z: 1.000 Count: 10

☐ Pick Flip End Level: 50.000 ☐ Pick

☐ Make closed polygons Compute From Selected

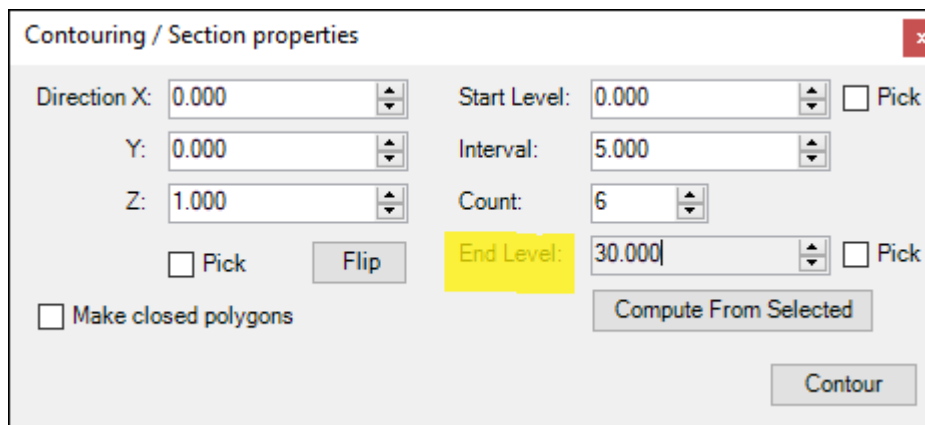

Choose direction and if needed start/end levels Contour

Then choose how many contours/sections you would like to be made:

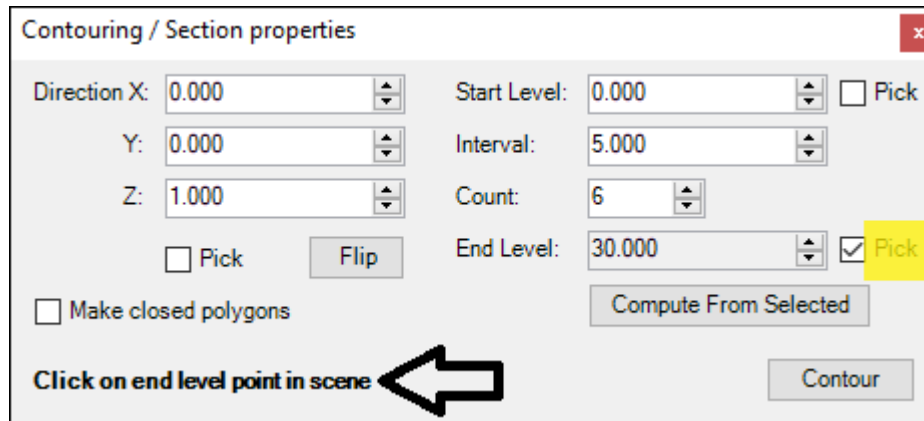

The screenshot shows a dialog box titled "Contouring / Section properties" with a close button (X) in the top right corner. The dialog contains several input fields and buttons. On the left, there are three vertical input fields for "Direction X:", "Y:", and "Z:", each with a value of 0.000, 0.000, and 1.000 respectively. Below these is a "Pick" checkbox and a "Flip" button. In the center, there is a "Count:" label with a value of 6, which is highlighted in yellow. To the right of the "Count" field are input fields for "Start Level:" (0.000) and "End Level:" (30.000), each with a "Pick" checkbox. Between the "Start Level" and "End Level" fields is an "Interval:" field with a value of 5.000. Below the "End Level" field is a "Compute From Selected" button. At the bottom right is a "Contour" button. A "Make closed polygons" checkbox is located at the bottom left.

Next you can choose what level you would like the contours/sections to end at (this will be adjusted automatically on changing the **Count** field):

This screenshot shows the same "Contouring / Section properties" dialog box as the previous one, but with the "End Level:" label highlighted in yellow. The "Count" field now shows a value of 6. The "Start Level:" field is 0.000 and the "End Level:" field is 30.000. The "Interval:" field is 5.000. The "Pick" checkboxes are still unchecked. The "Compute From Selected" and "Contour" buttons are still present at the bottom right. The "Make closed polygons" checkbox is still at the bottom left.

Optionally you can tick on the **Pick** box and click in your scene to choose the **End Level**:

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☐ Pick

Y: 0.000 Interval: 5.000

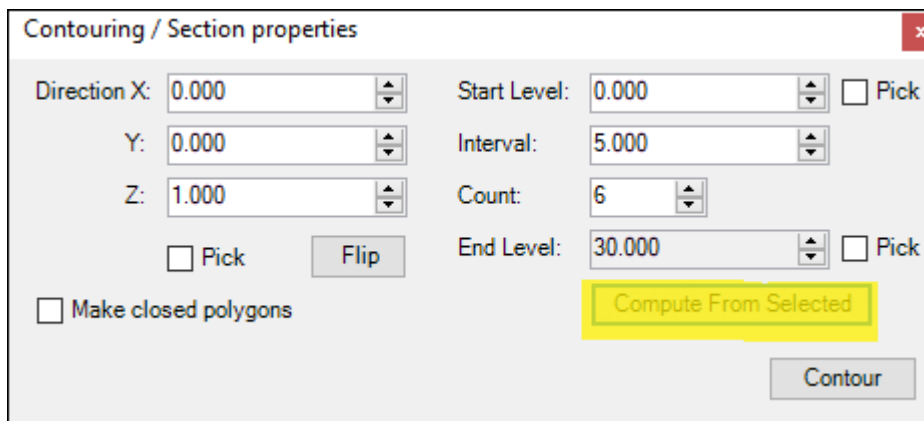

Z: 1.000 Count: 6

☐ Pick Flip End Level: 30.000 ☒ Pick

☐ Make closed polygons Compute From Selected

Click on end level point in scene Contour

Clicking on the **Compute From Selected** button will compute start and end levels from the selected surface (if the parameters you have entered in make sense, then nothing will change):

Contouring / Section properties

Direction X: 0.000 Start Level: 0.000 ☐ Pick

Y: 0.000 Interval: 5.000

Z: 1.000 Count: 6

☐ Pick Flip End Level: 30.000 ☐ Pick

☐ Make closed polygons Compute From Selected

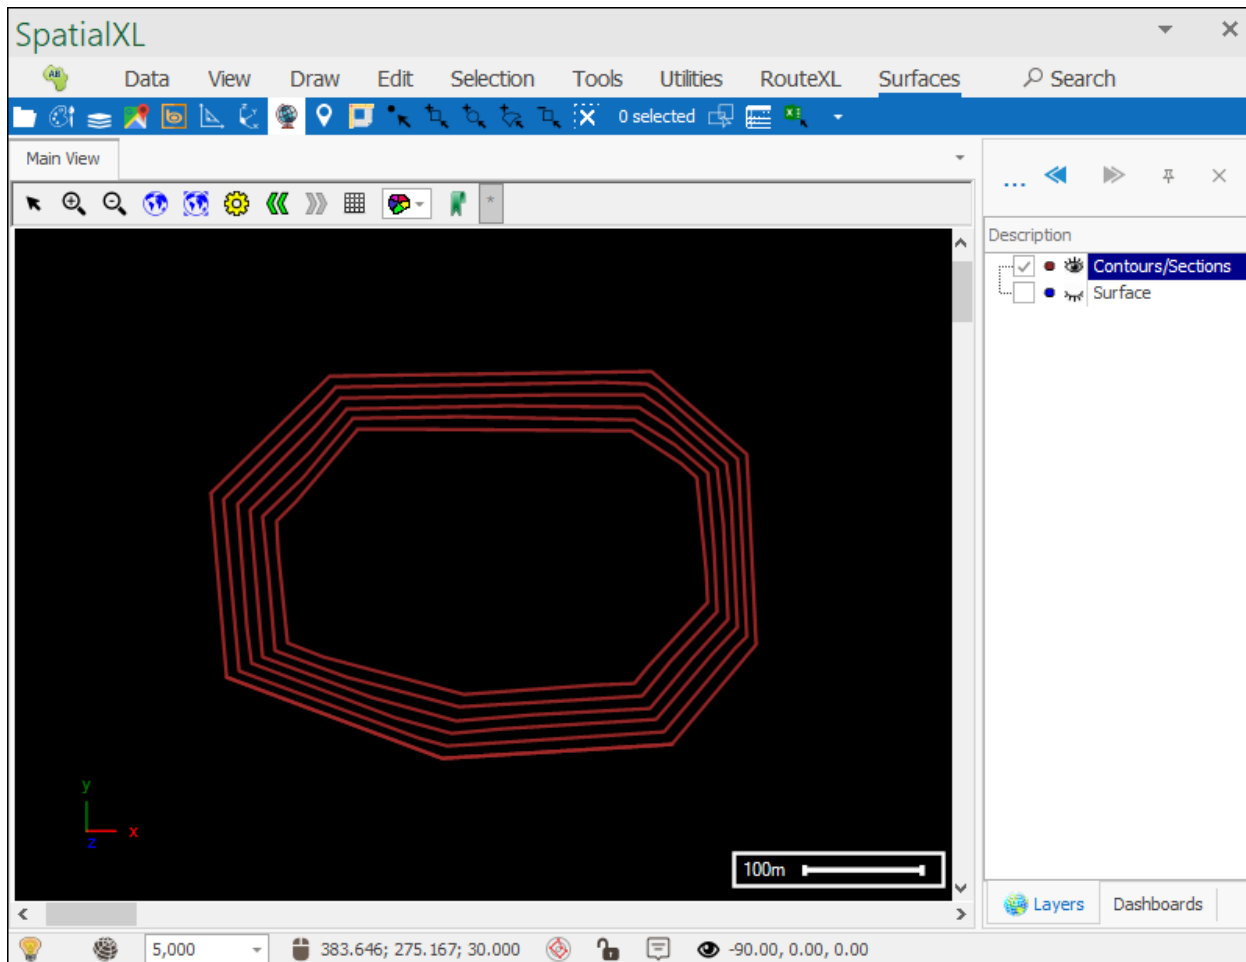

Contour

Finally click **Contour**:

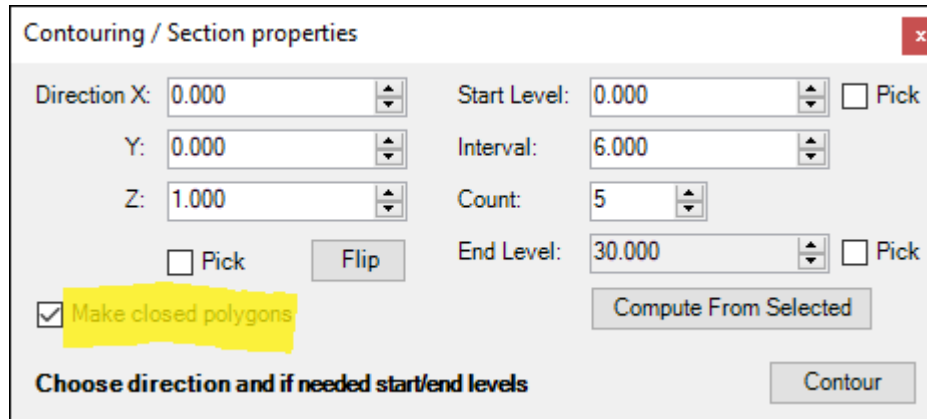

Contouring / Section properties

Direction X:	0.000	Start Level:	0.000	<input type="checkbox"/> Pick
Y:	0.000	Interval:	5.000	
Z:	1.000	Count:	6	
<input type="checkbox"/> Pick	Flip	End Level:	30.000	<input type="checkbox"/> Pick
<input type="checkbox"/> Make closed polygons			Compute From Selected	
Contour				

Your surface has now been contoured:

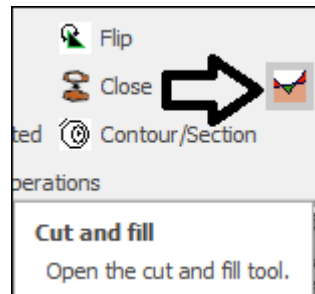

If you want to make closed polygons between levels instead of contours then make sure to have **Make closed polygons** ticked on before contouring:

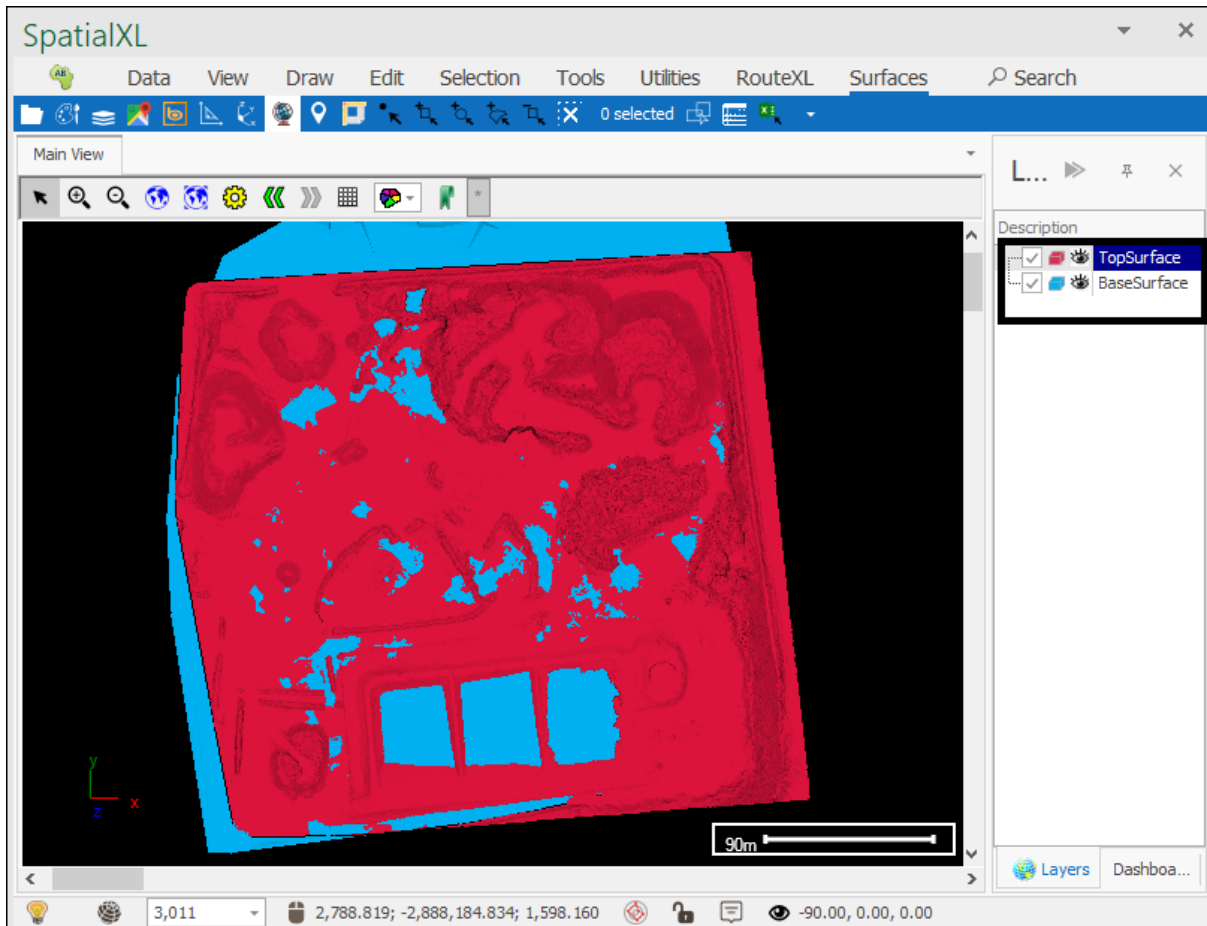

Cut and fill

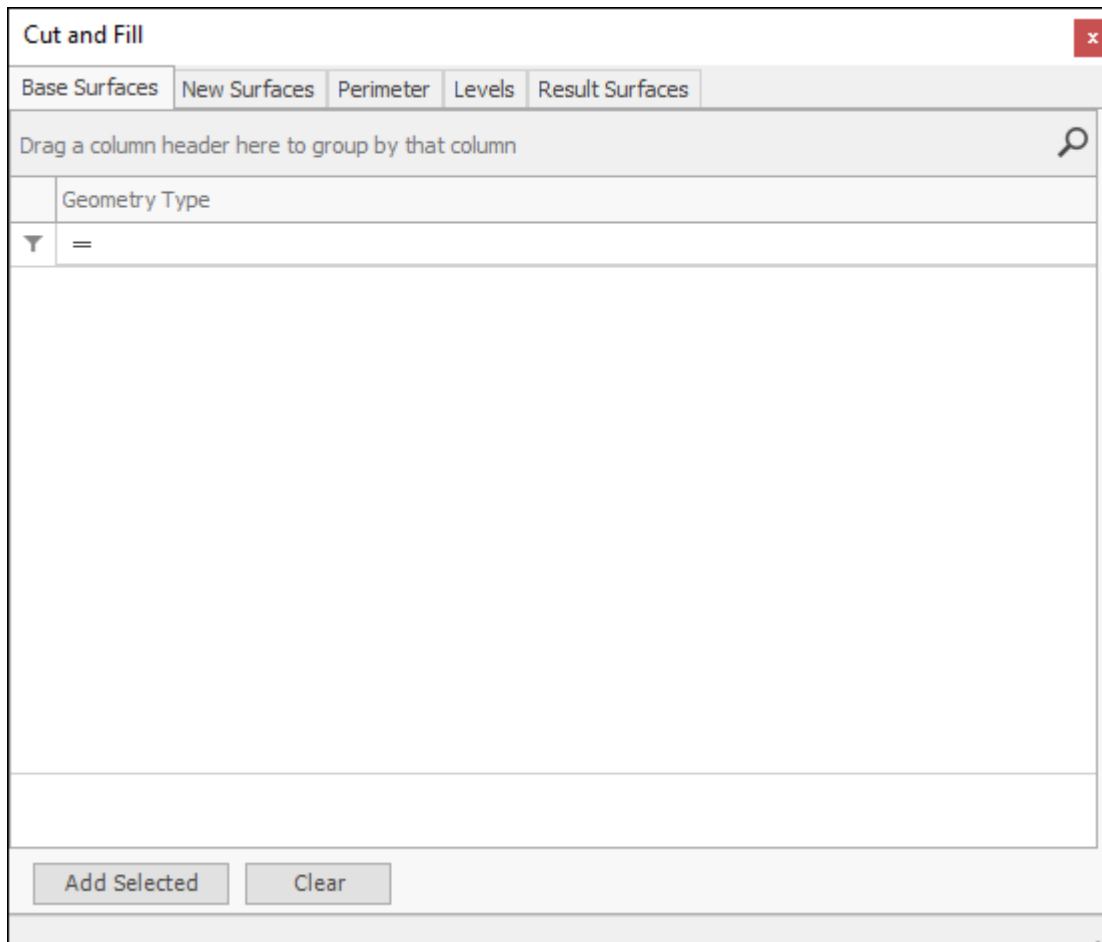

The next tool is the **Cut and fill** tool which will calculate how much one surface cuts (goes into) and fills (goes over) another:

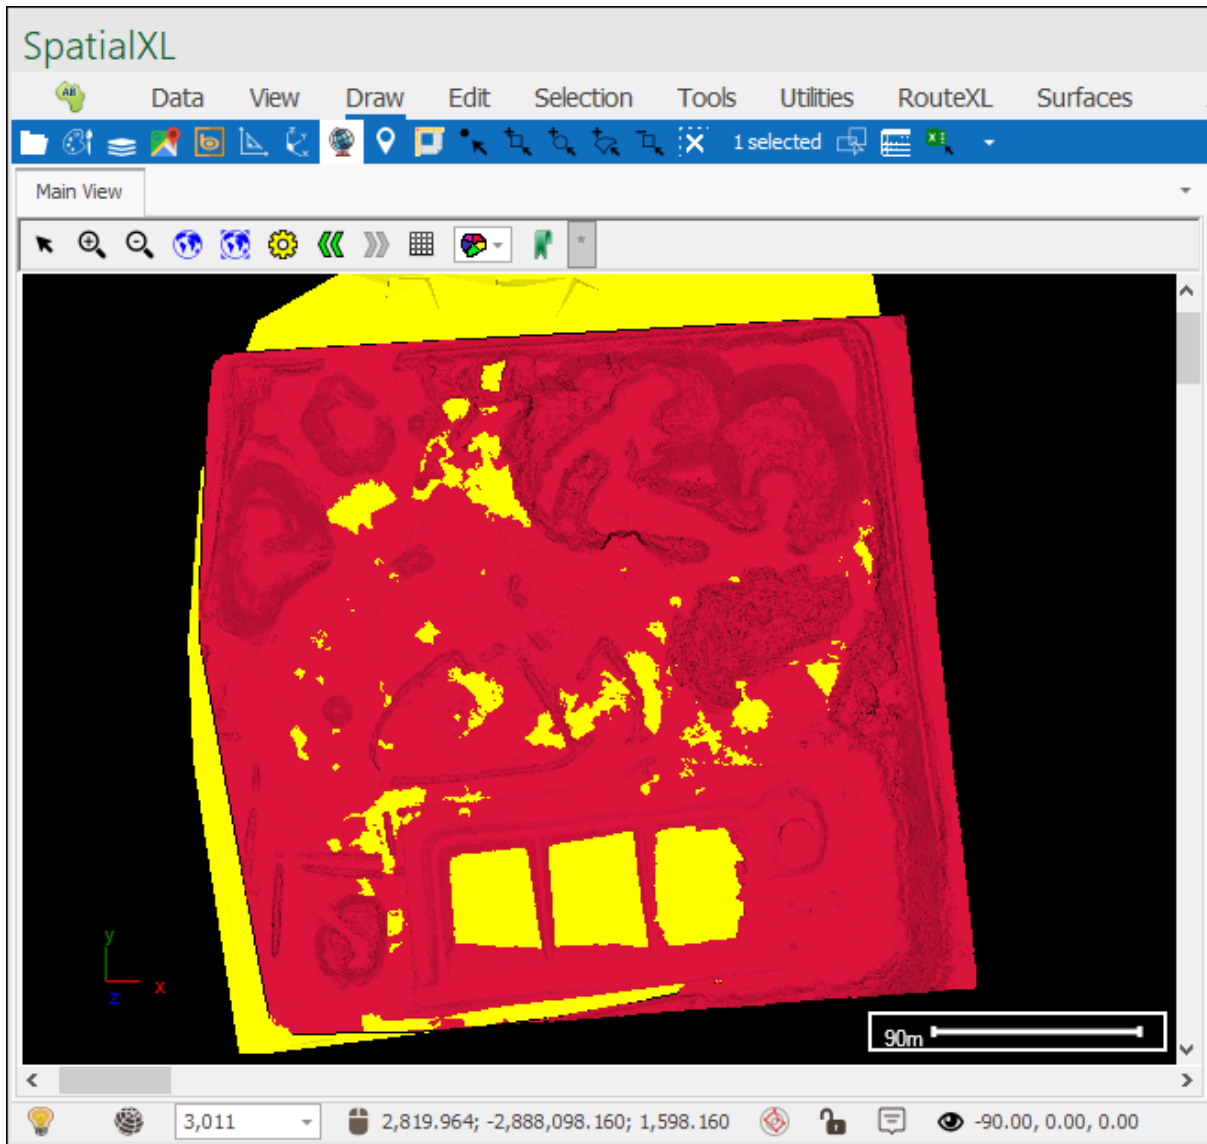

You would need a base surface and an over or underlying surface to do this operation:

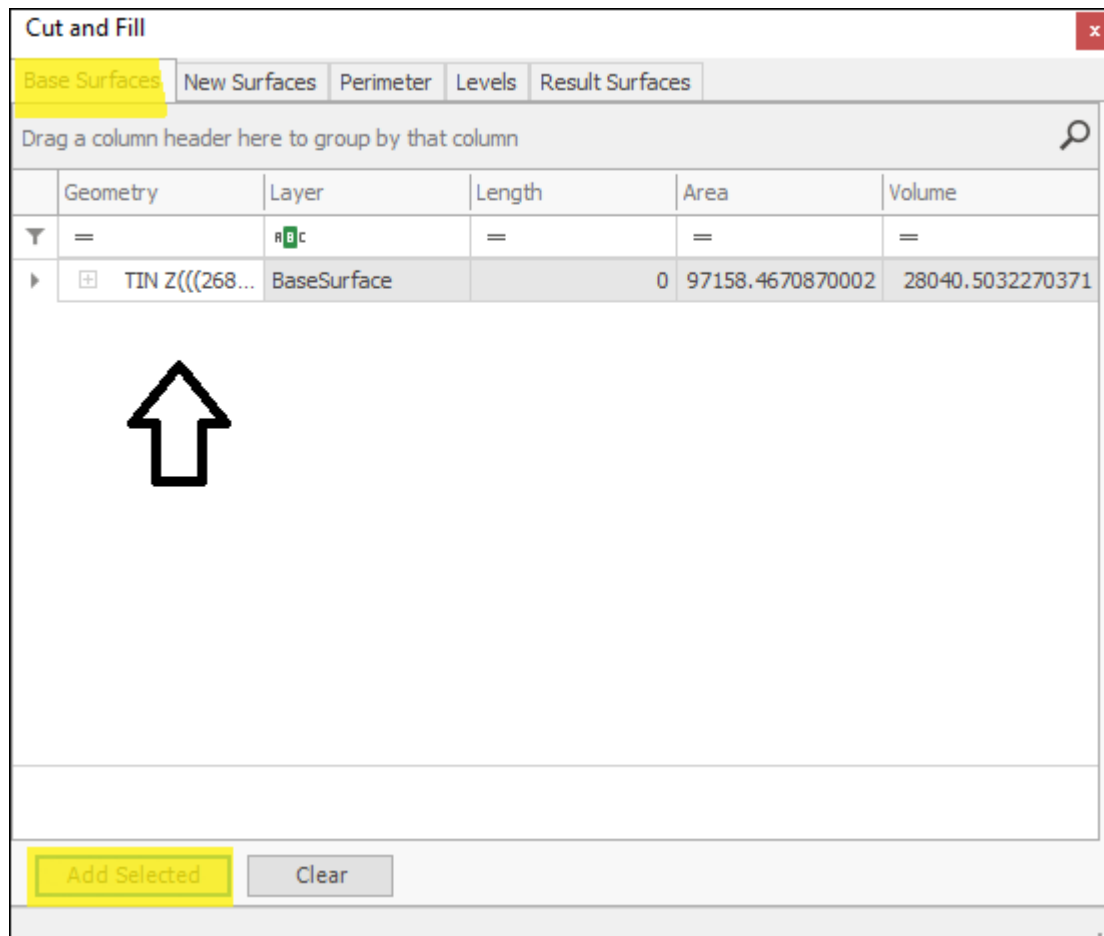

Then you would open the tool which brings up the following dialogue:

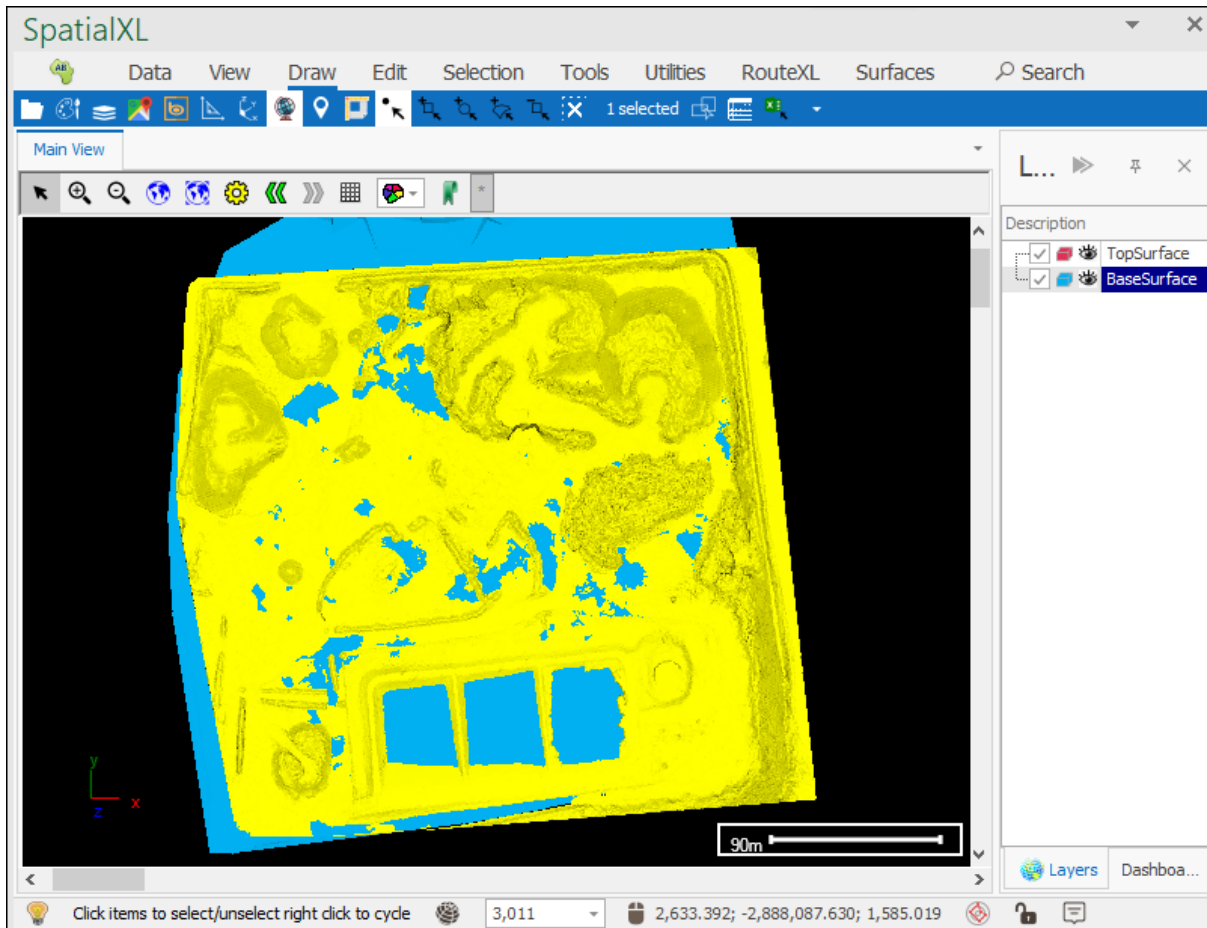

First select your base surface:

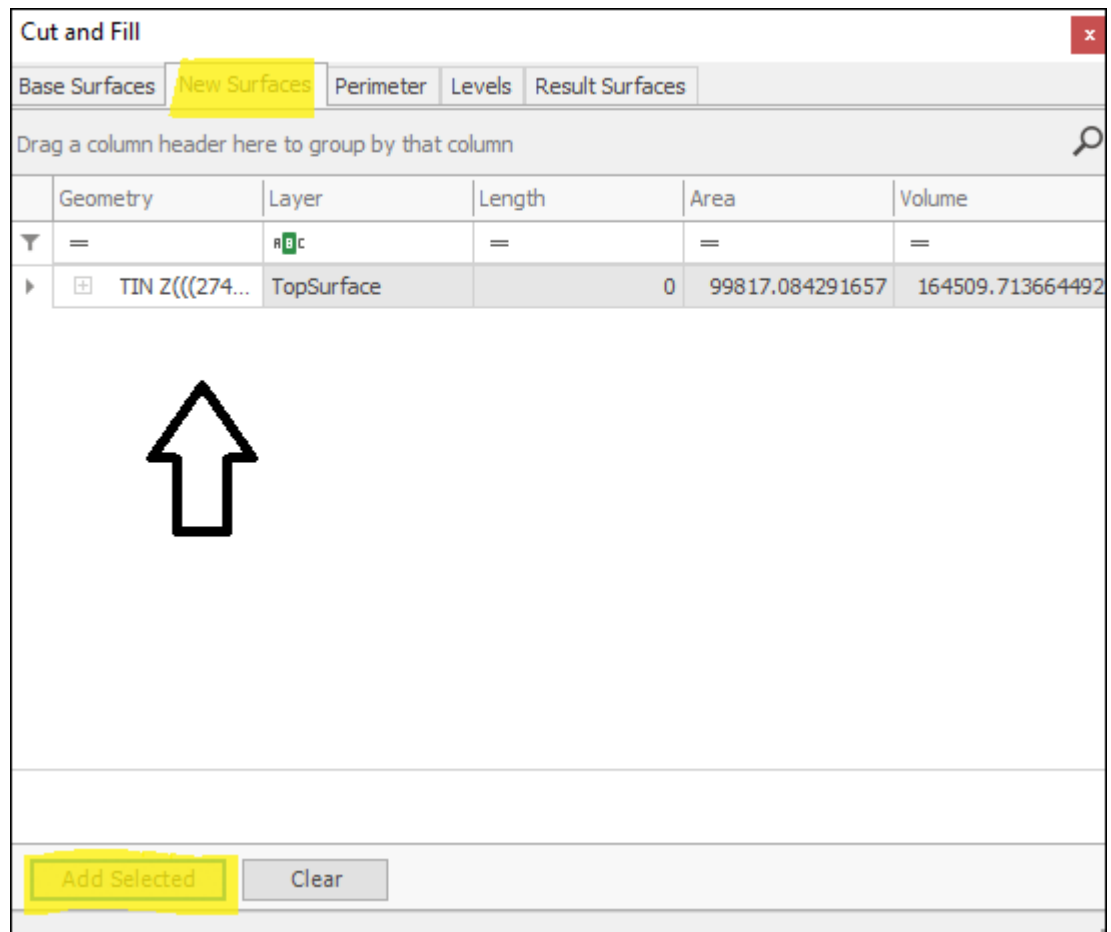

Then in the **Base Surfaces** tab click **Add Selected** to put in the geometries of the base surface:

Next select your over or underlying surface:

Then go to the **New Surfaces** tab and click **Add Selected** to put in the geometries for the surface:

Next, optionally, if you only wanted to do the cut and fill operation within a certain perimeter then you would select the polygon that defines such a perimeter on the surface and then add it in here by the **Perimeter** tab:

Next, in the **Levels** tab, if you just want to do the cut and fill operation on one level then click **Cut and Fill** (The **Cell Size** is by default 10 but can be changed, these are the cells used between the surfaces in doing the calculation, the smaller the cell the more precise the calculation):

Cut and Fill

Cut and Fill

Cut and fill complete

The elevations **From** and **To** are populated together with the square meters for the **Cut** and **Fill**.

In the **Result Surfaces** tab are the resulting Cut and Fill surfaces together with their volumes, to create a layer out of these click **Create Layer**:

Cut and Fill

Base Surfaces

New Surfaces

Perimeter

Levels

Result Surfaces

Drag a column header here to group by that column

	Geometry	Cut/Fill	Volume	Closed
▼	=	ABC	=	<input checked="" type="checkbox"/>
▶	TIN Z(((2455.63 -2888...	Cut	4106.300	<input type="checkbox"/>
	TIN Z(((2505.63 -2888...	Fill	286.360	<input type="checkbox"/>

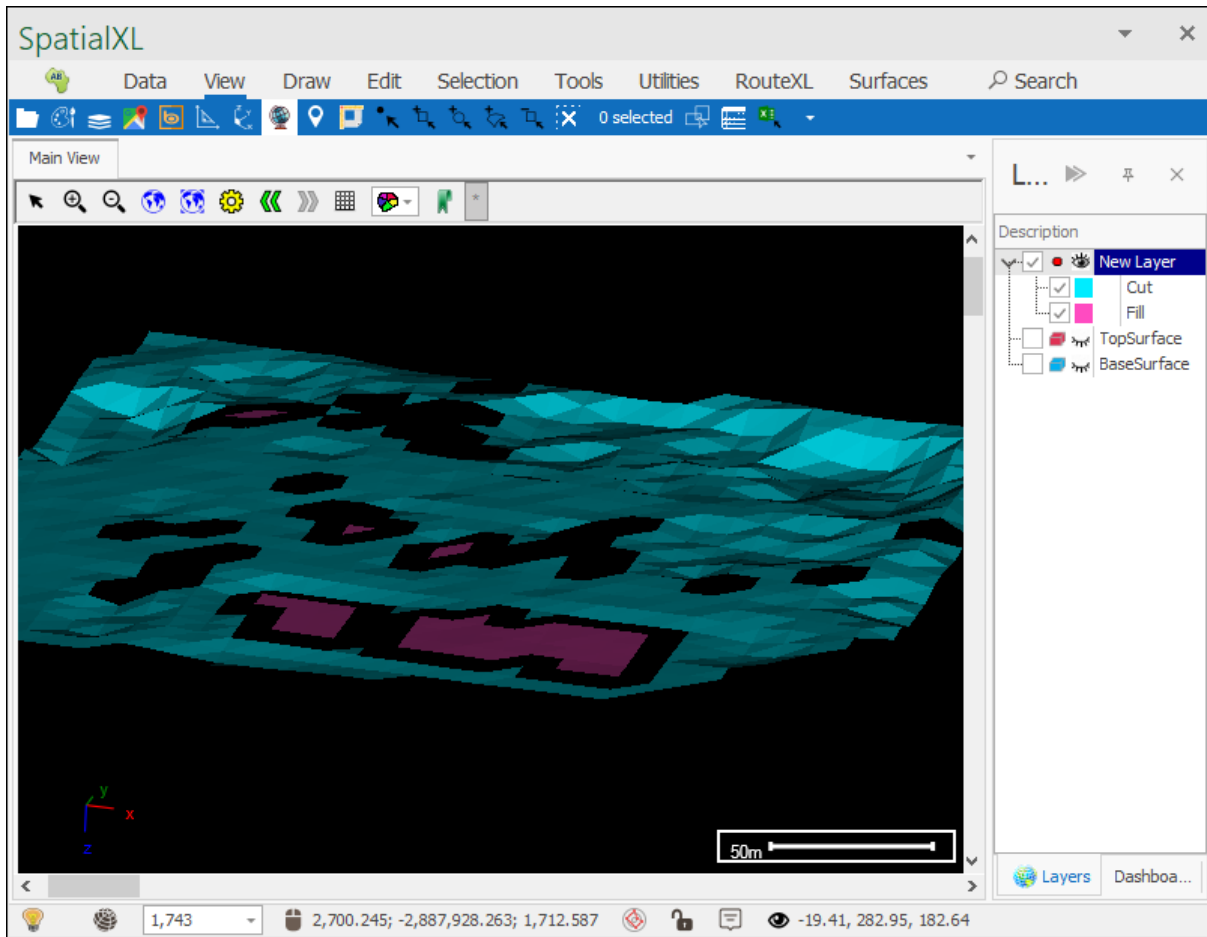

Create Layer

Cut and fill complete

You can then theme this layer to clearly see the cut and fill:

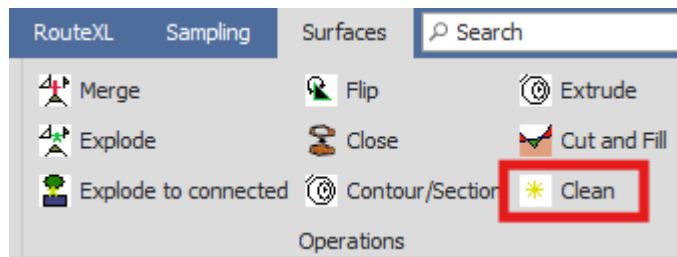

If you want to do the cut and fill on levels then you can set this in the **Levels** tab by clicking **Auto Set** and then putting in the number of levels you want by **Number of levels**:

The screenshot shows the 'Cut and Fill' application window. At the top, there are tabs: 'Base Surfaces', 'New Surfaces', 'Perimeter', 'Levels', and 'Result Surfaces'. The 'Levels' tab is currently selected. Below the tabs is a table with columns: ID, From, To, Cut, and Fill. A small orange star icon is in the first row of the table. In the center of the window, a dialog box titled 'Auto calc levels' is open. This dialog has input fields for 'Interval' (set to 2), 'From' (set to 1578), 'To' (set to 1598), and 'Number of levels' (set to 10). The 'Number of levels' field is highlighted in yellow. To the right of these fields is a 'Calc' section with two radio buttons; the top one is selected. At the bottom of the dialog is an 'OK' button, which is also highlighted with a blue border. Below the table in the main window, there are summary fields: '0', 'Min:', 'Max:', 'Total:0.00', and 'Total:0.00'. At the very bottom of the window, there is a 'Cell Size' dropdown set to '10.0', and three buttons: 'Clear', 'Auto Set' (highlighted in yellow), and 'Cut and Fill'.

Then click **OK** and then **Cut and Fill** and your results are now on levels:

Cut and Fill

Cut and fill complete					

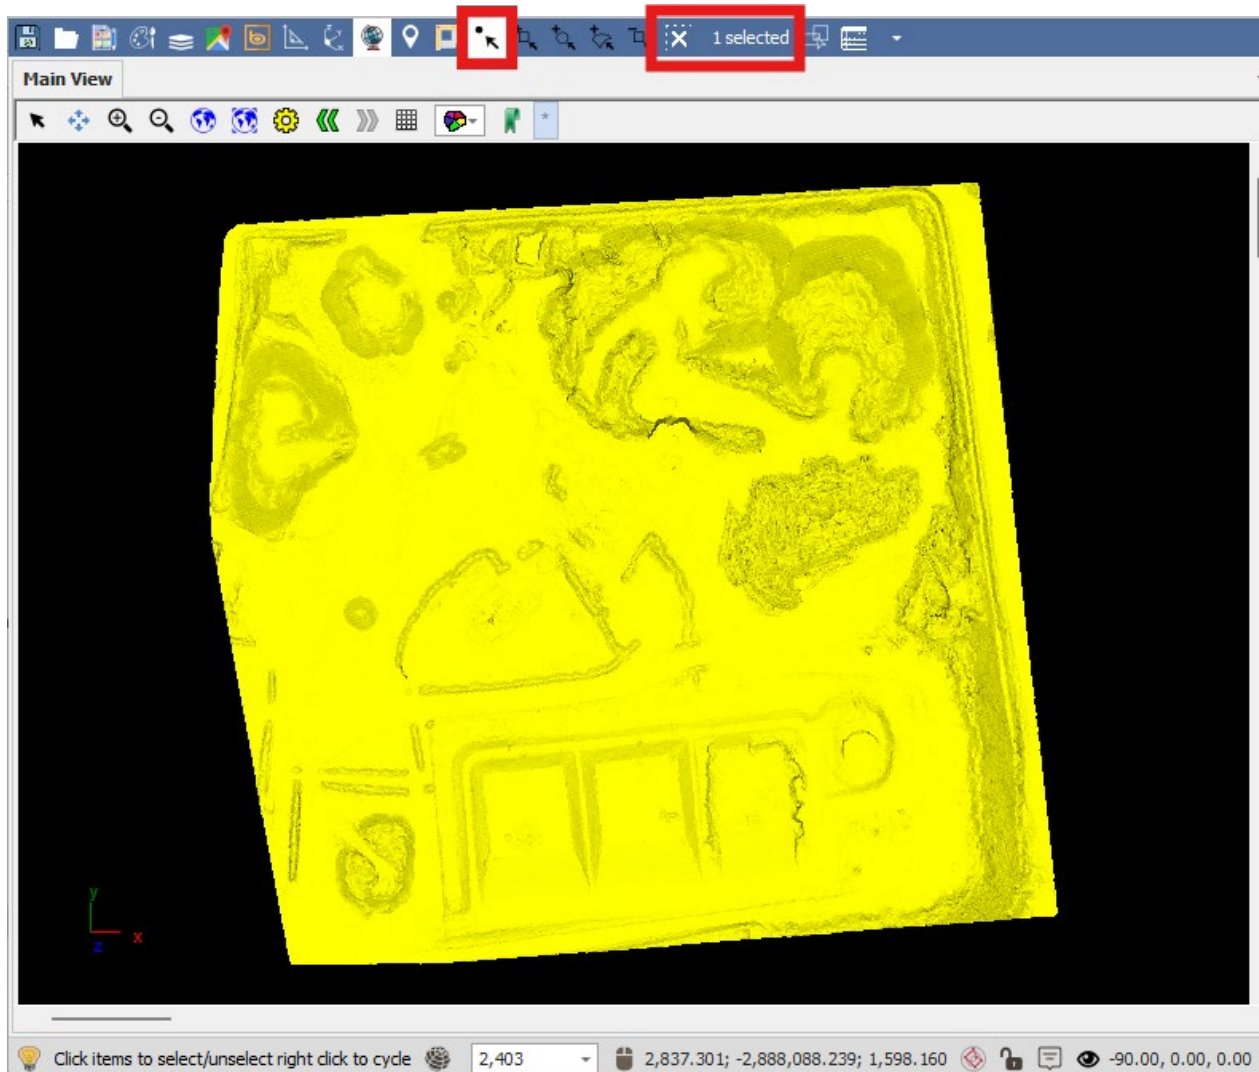

Clean

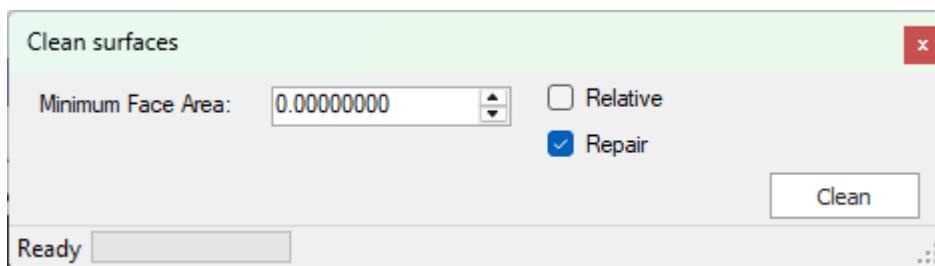

The “Clean” tool can be used to clean up a surface of small artefacts/parts and re-pair it as needed.

Sometimes you may have a surface where two faces are cutting into each other and the “Clean” tool will clean this up for you.

First, select the surface you want to clean by using one of the selection tools:

Then launch the “Clean” tool.

The default setting is just the “Repair” option checked on.

However, if you want to also get rid of any faces of the surface that are smaller than a specified amount you can specify a “Minimum Face Area” as well.

The “Relative” checkbox, if checked, means that the minimum face area will be entered and calculated as a percentage of the total surface area. If unchecked, the amount you enter will be an absolute area amount.

When you are ready you can go ahead and click the {Clean} button and your surface will be cleaned.

Edit

Delete Facets

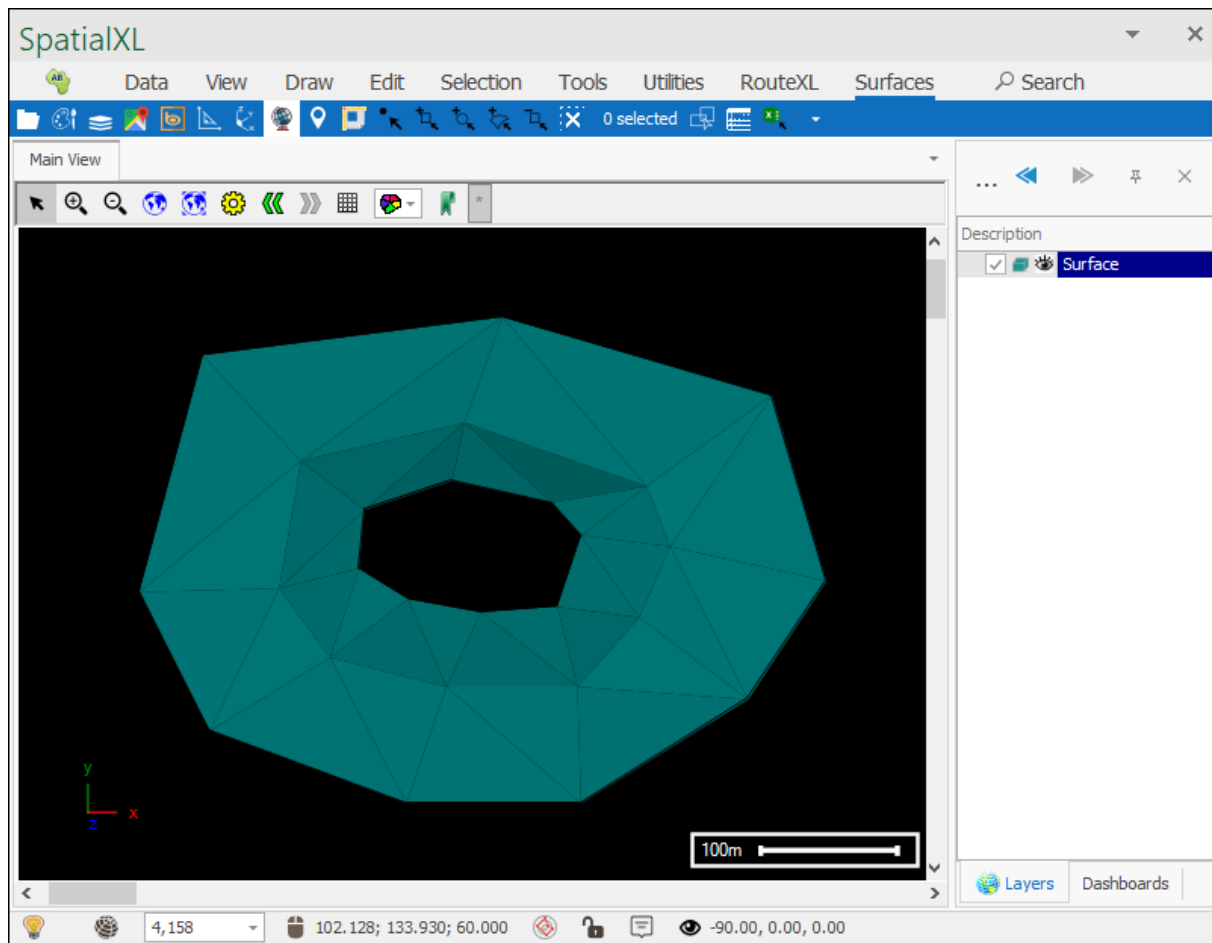

The **Delete Facets** tool allows you to delete facets of a surface:

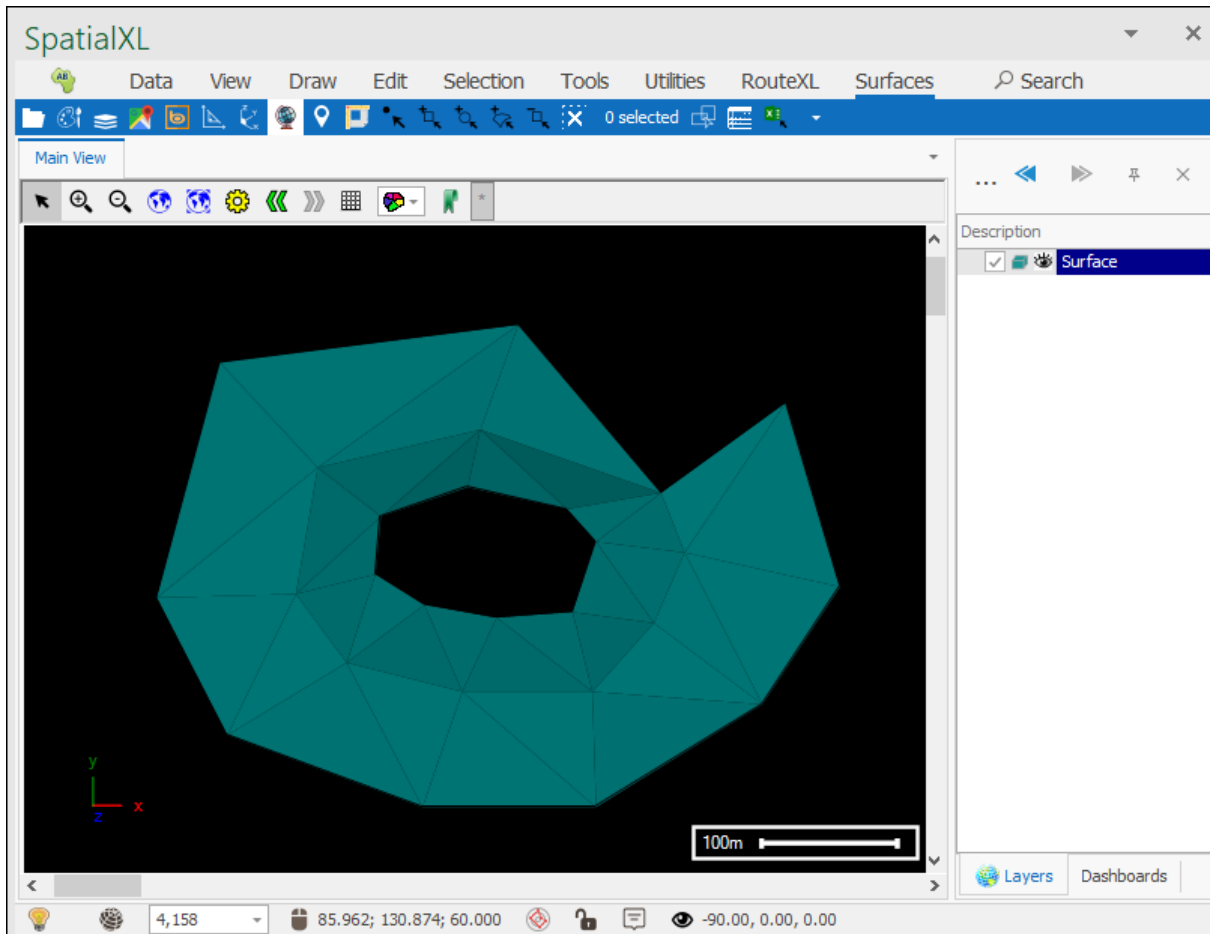

Before using this tool make sure that your surface layer has **Editable** ticked on in its Layer Properties box:

Select the tool and then click on the facets of your surface that you want to delete:

Delete Vertex

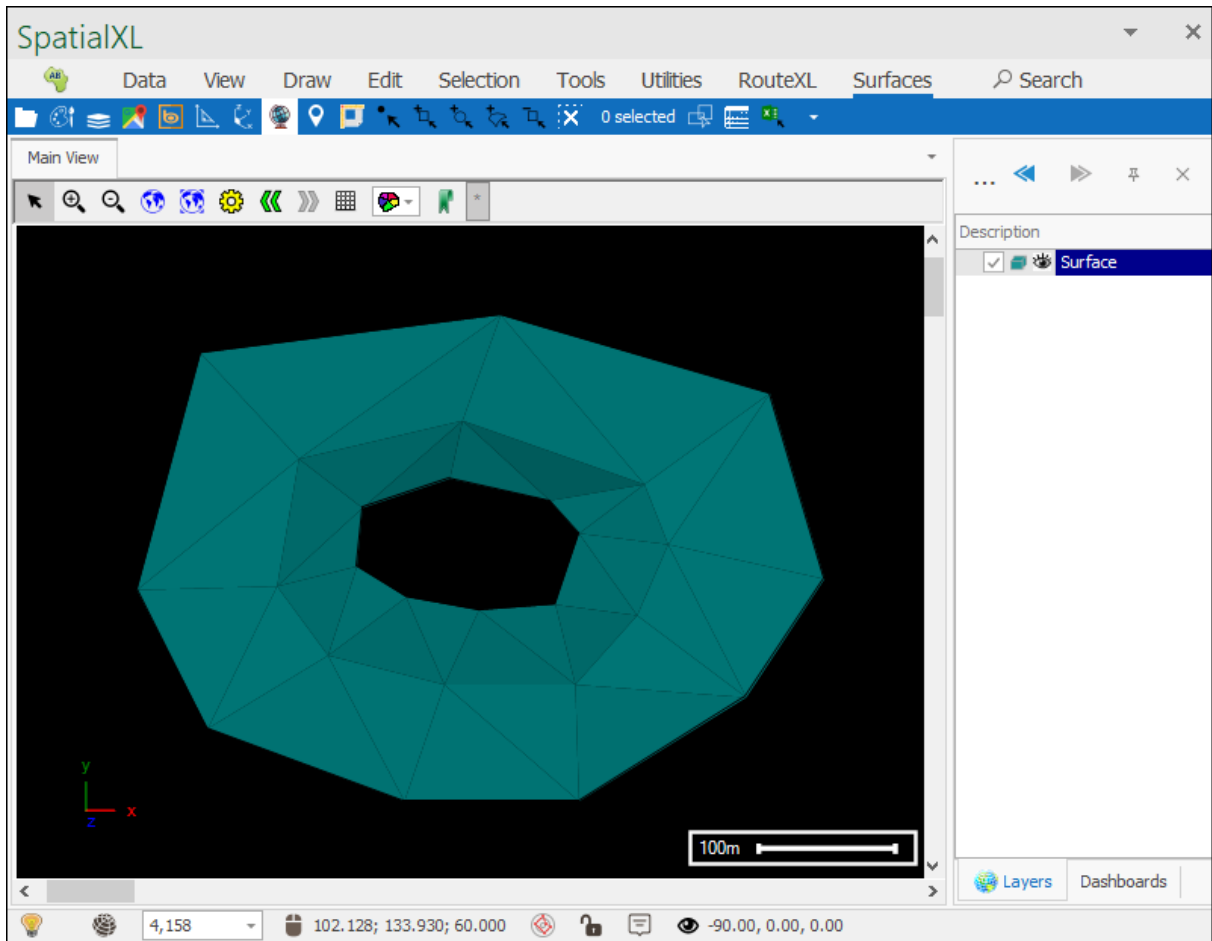

The **Delete Vertex** tool allows you to delete vertices from your surface:

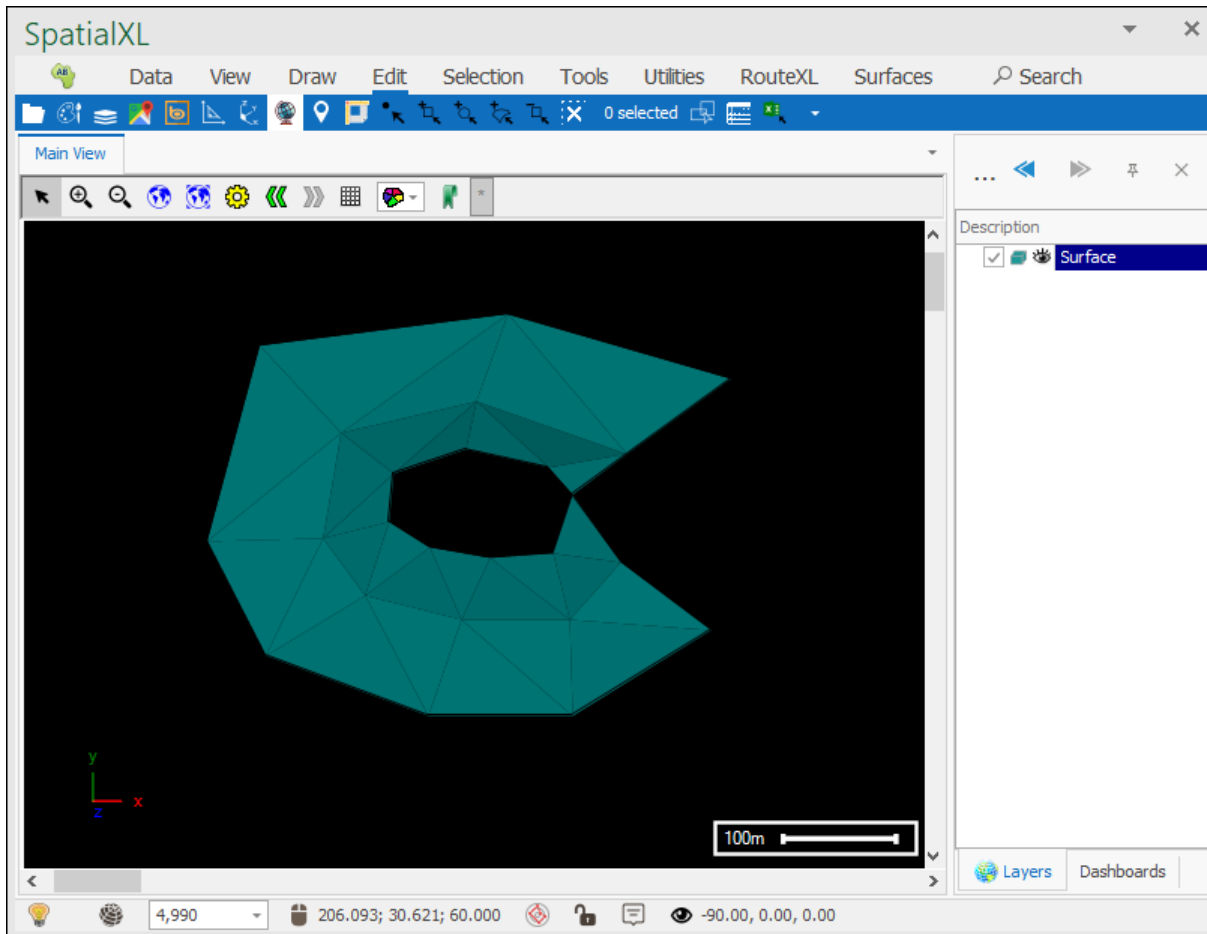

Make sure **Editable** is ticked on in the layer before using the tool:

Select the tool and then click on the vertices you would like to delete from your surface:

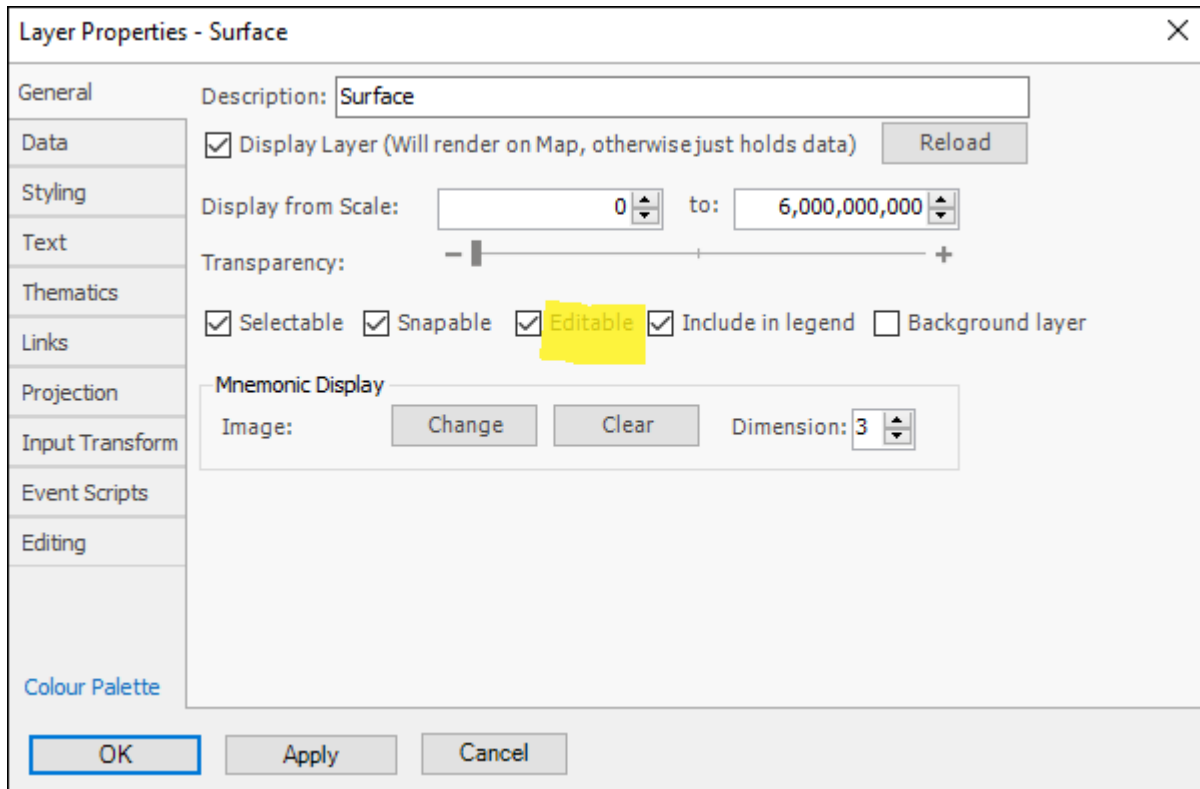

Flip Edge

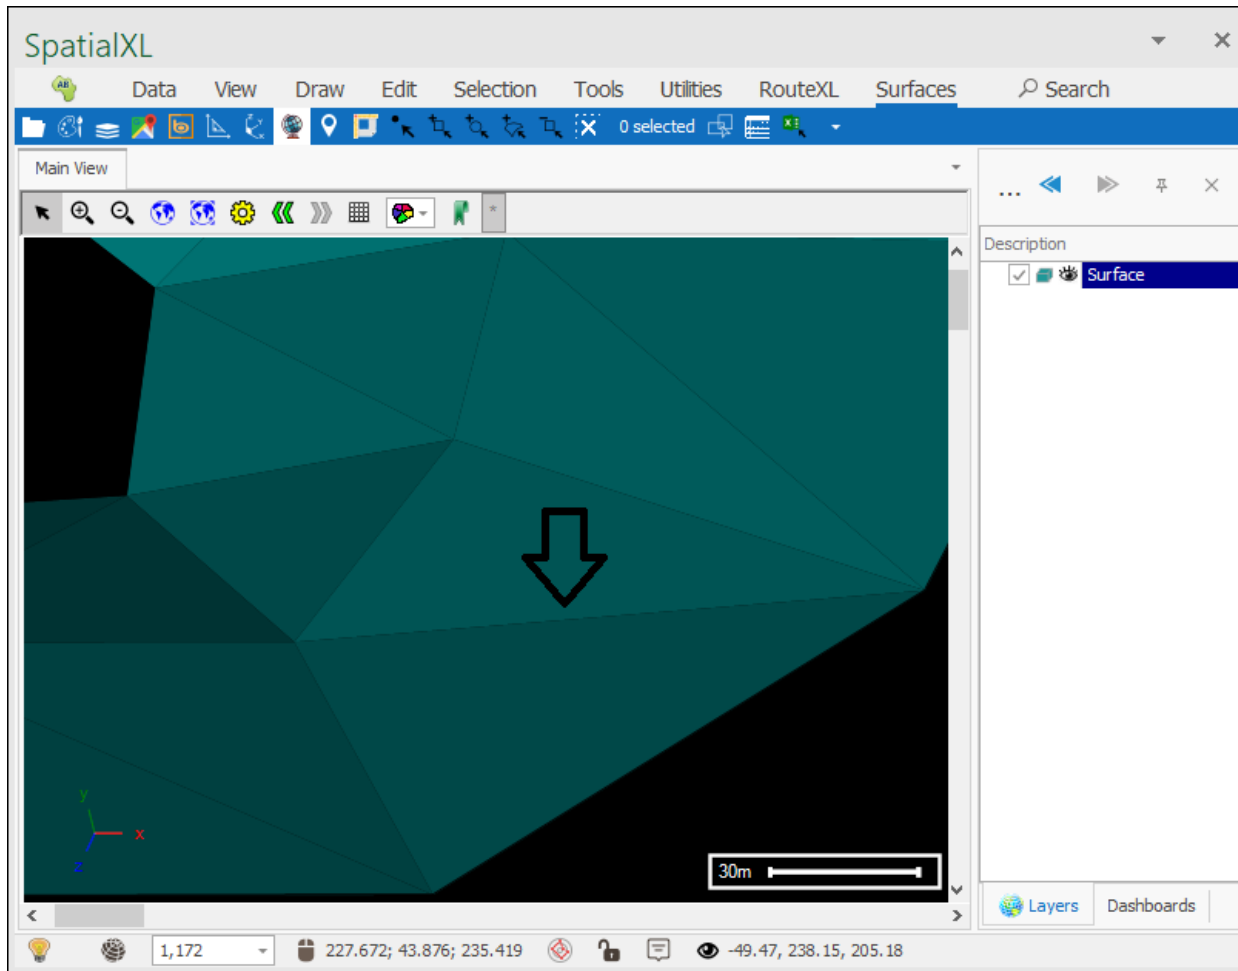

The next tool is the **Flip Edge** tool which allows you to flip the edges of a surface:

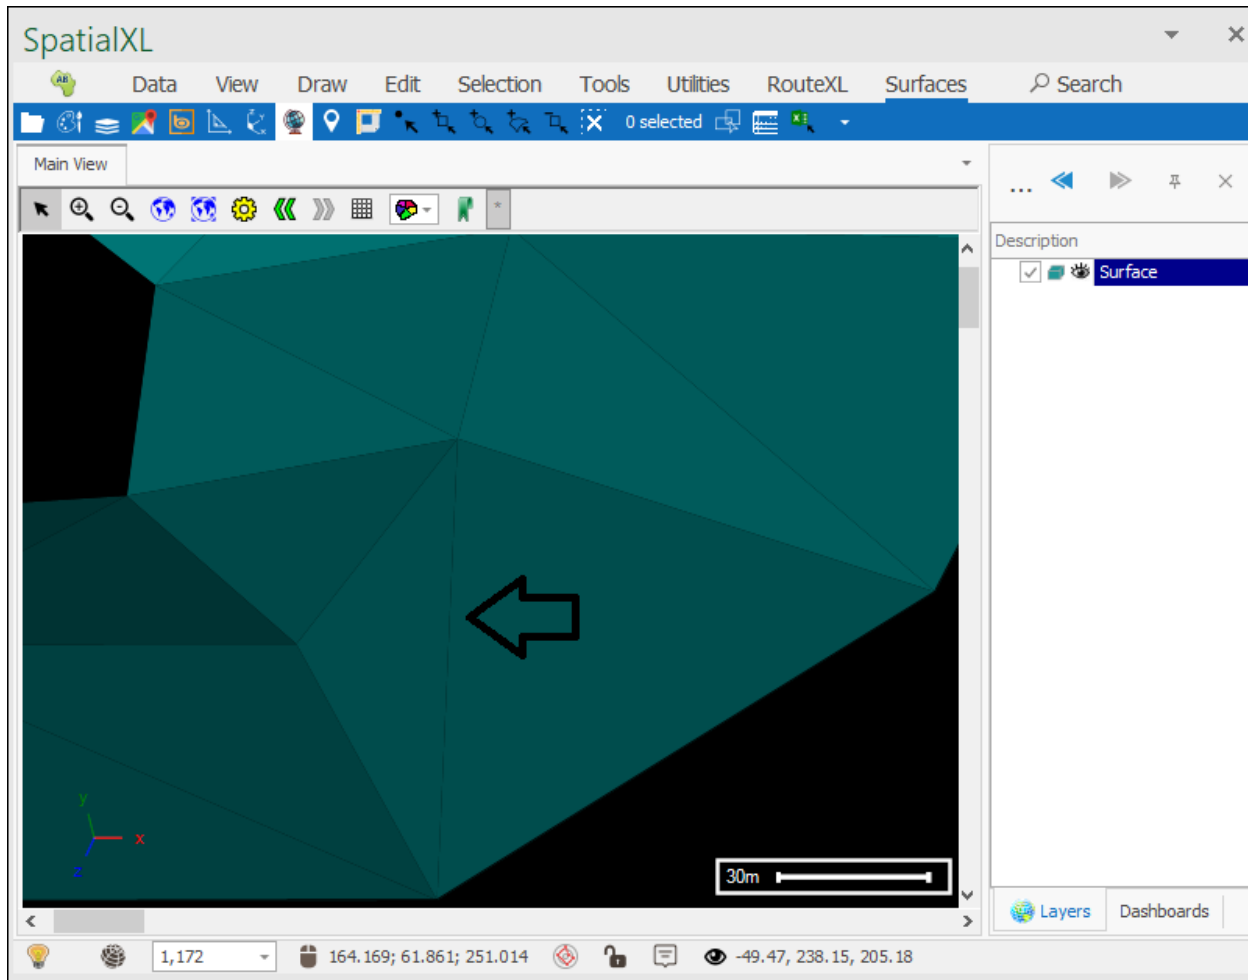

Make sure **Editable** is ticked on in the layer before using the tool:

Select the tool and then click on the edges you want to flip in your surface:

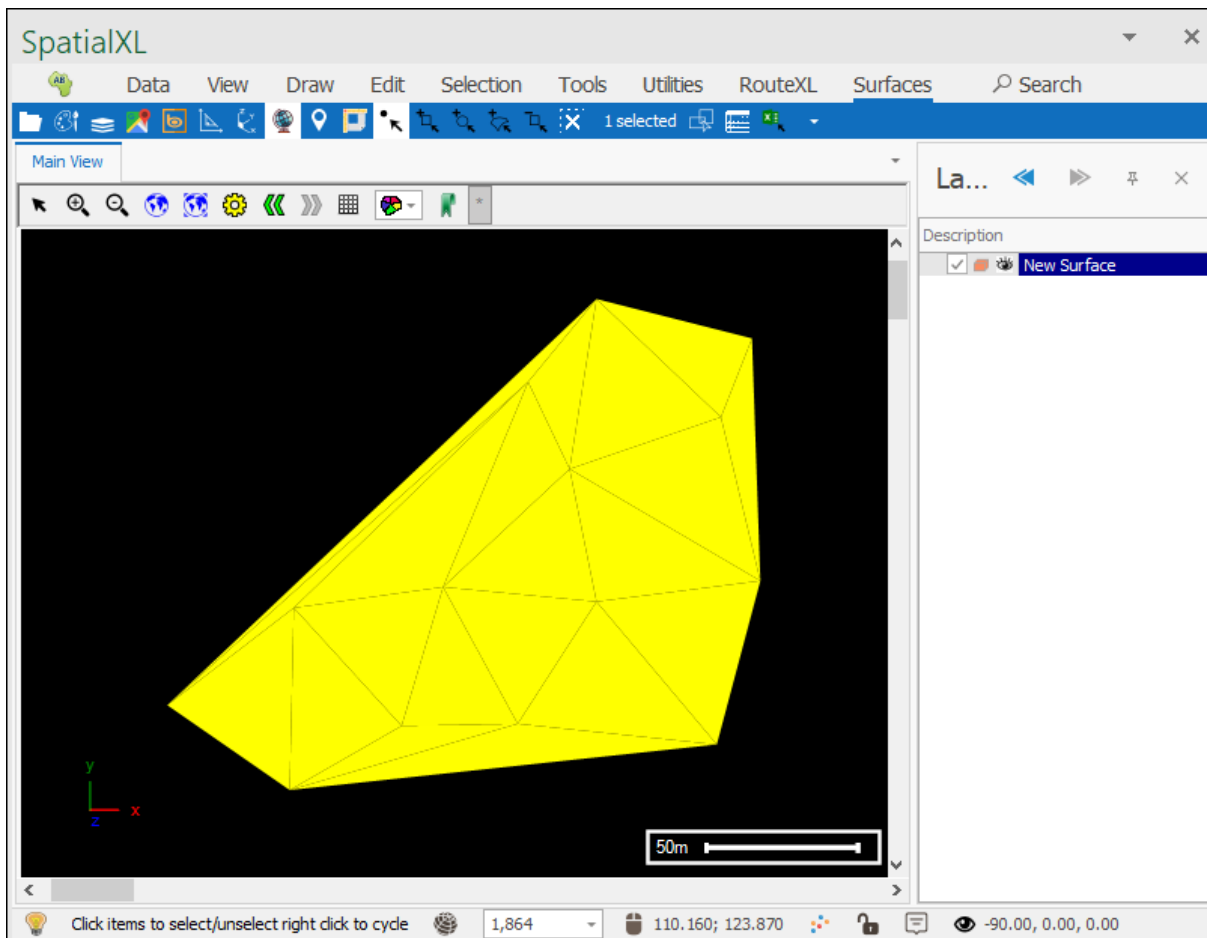

Trim Surface

The Trim Surface tool can be used to trim off unwanted parts of a surface:

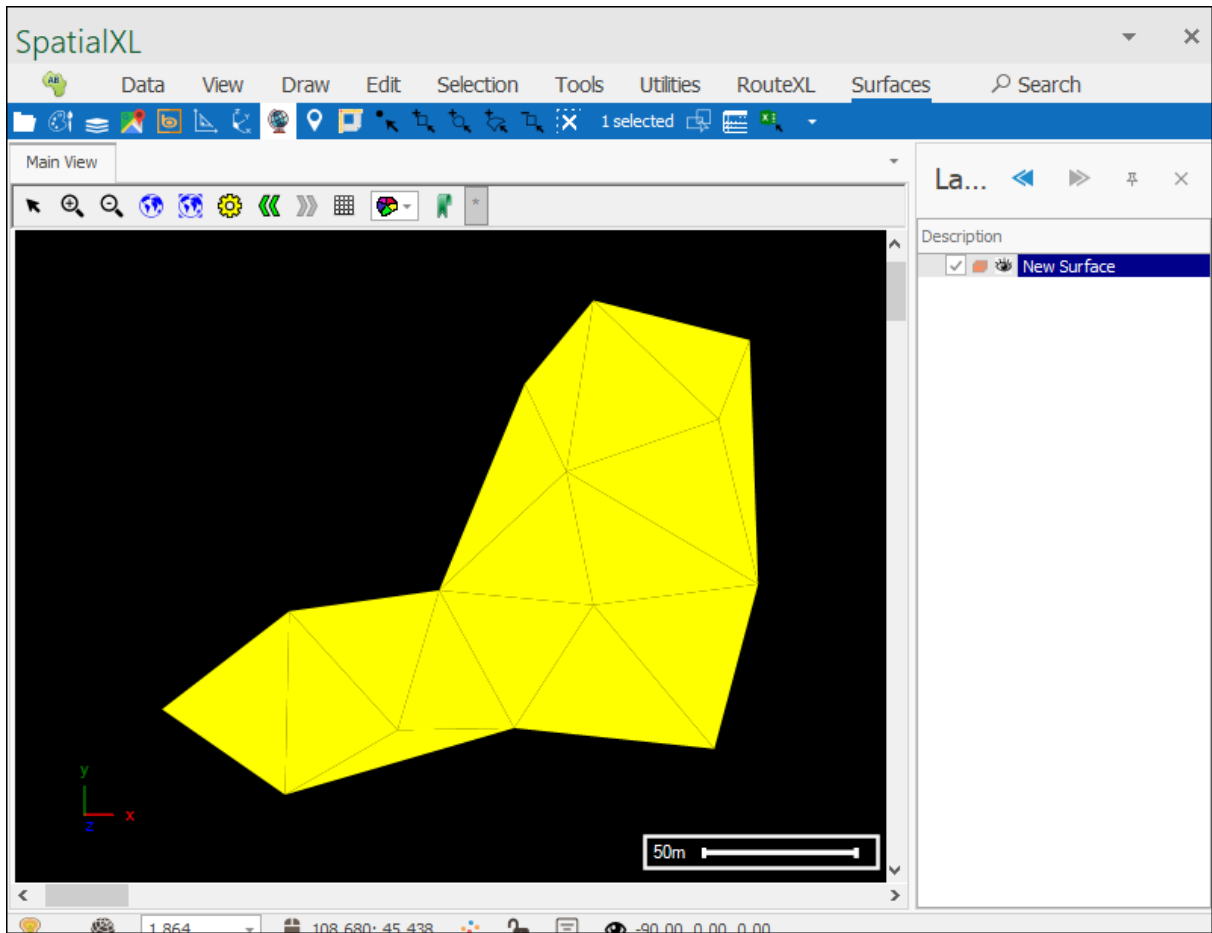

First select the surface you want to trim:

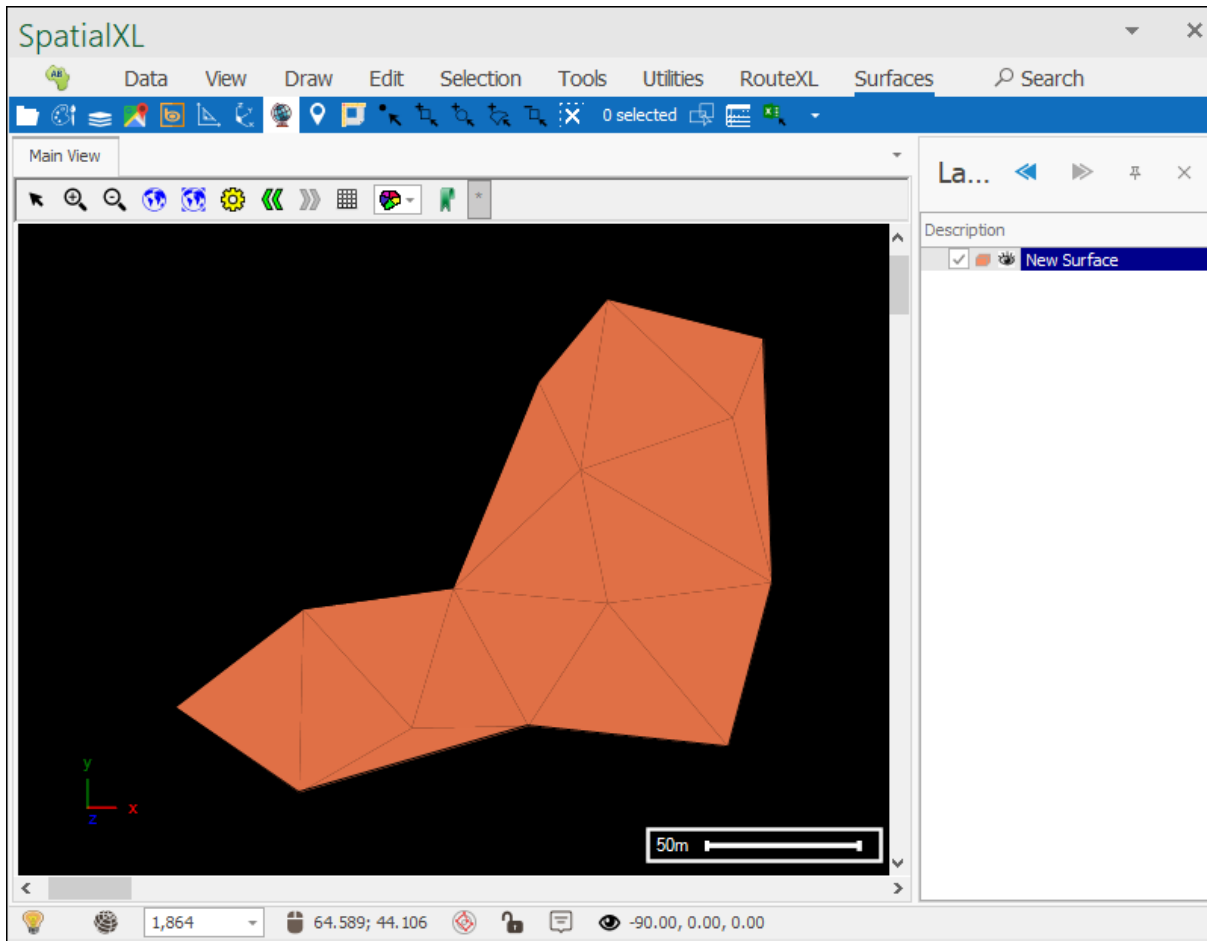

Then open the Trim tool which will bring up the following dialogue:

Here you are choosing the distance of edges of the facets of your surface beyond which you would like the facets to be trimmed. For example, here I want any facets with edges over 100 meters long to be trimmed, once you have entered in your distance click **Trim Selected**:

And as you can see my surface has been trimmed.

Extract

The Extract section of the Surfaces tab has tools to extract the boundaries of surfaces and also to split surfaces.

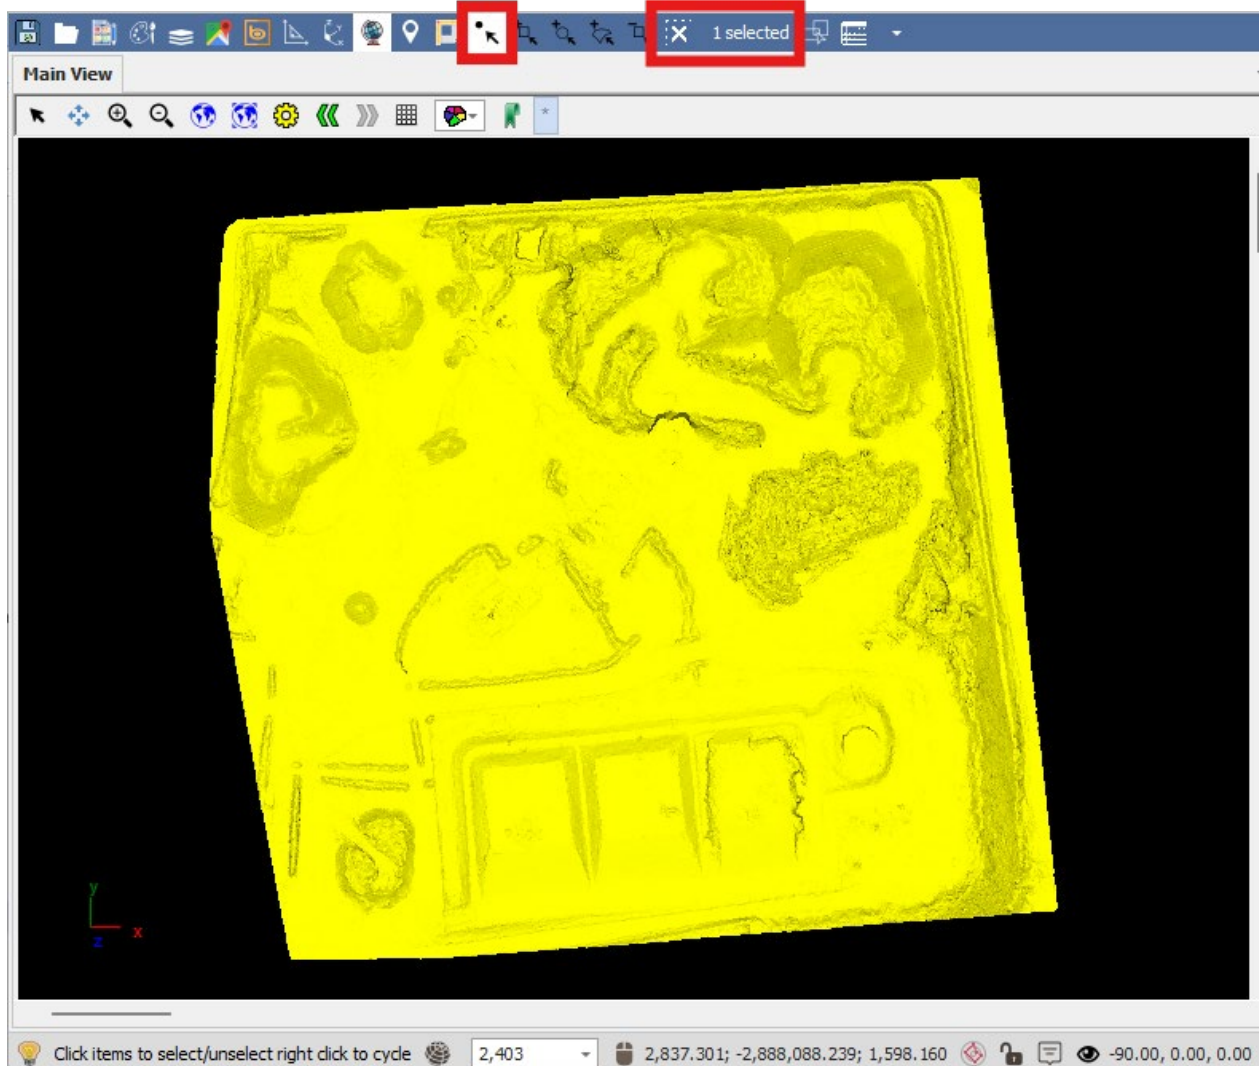

Boundary

The Boundary tool will extract the boundary of your surface for you into a new layer or any layer you have set as active.

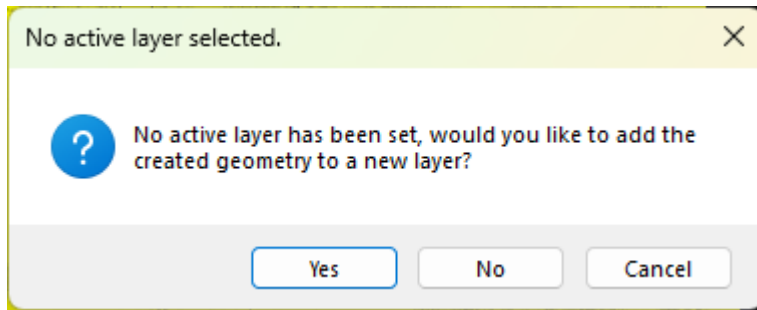

This will only work if you have an open surface. This can be useful for example to find areas where your surface is not closing such as where there are holes.

First, select the surface by using one of the selection tools:

Then click the “Boundary” tool button.

It will prompt you to create a new layer if you do not already have one set as active.

Click {Yes} then your boundary is extracted.

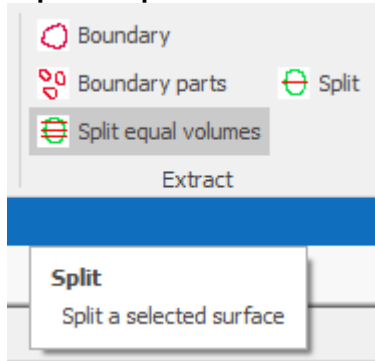

Boundary Parts

The “Boundary Parts” tool will do the same as the “Boundary” tool except that it will extract the boundaries of your surface into separate linestrings. So for example, if you have a whole in your surface, that boundary part will be its own linestring element.

Split equal volumes

The Split equal volumes tool allows you to split one or more surfaces that you select, into equal volumes based on the parameters you set.

First, select the surface or surfaces using one of the selection tools:

Next, you will need to make sure you have an active layer for the split surfaces to go into. You can make an existing layer active (by right clicking on the layer and selecting “Active”) or add a new one.

To add a new one, you can click the “Add layer” button in the quick access toolbar:

Then, give the layer a name in the Description field of the Layer Properties box, then in the Data tab choose the layer to be created with an ID and Description column, then click Create and OK on the Layer Properties box:

Cancel

Finally, make the newly added layer Active, by right clicking on the layer and selecting “Active”, so it can receive the surfaces we will split:

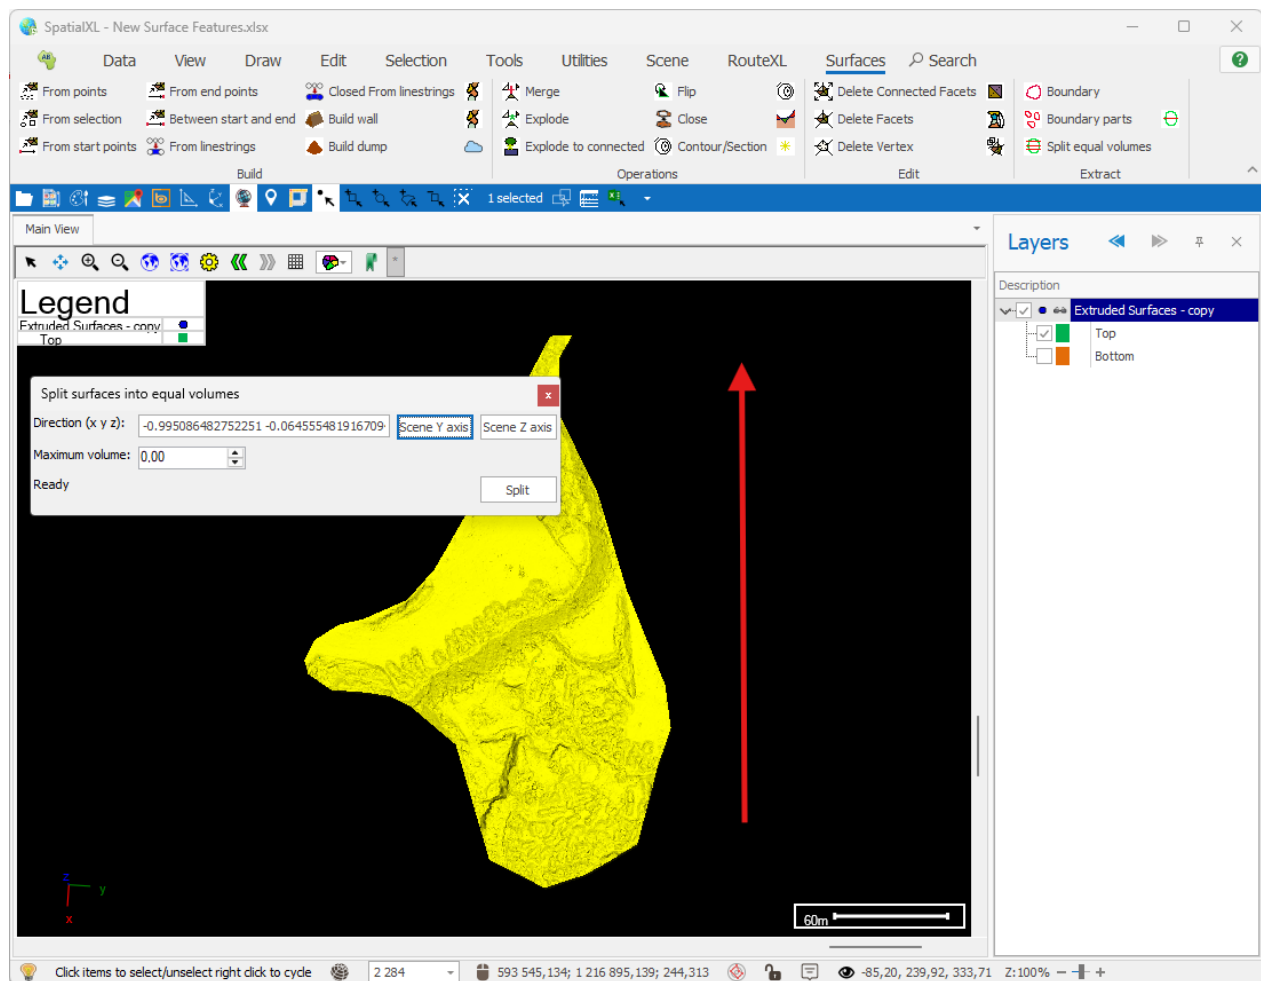

You can now open the Split equal volumes tool. It will bring up the following dialogue:

The Direction (x y z) field can be specified manually, or you can get the Y or Z axis of your scene by clicking the “Scene Y axis” or “Scene Z axis” button.

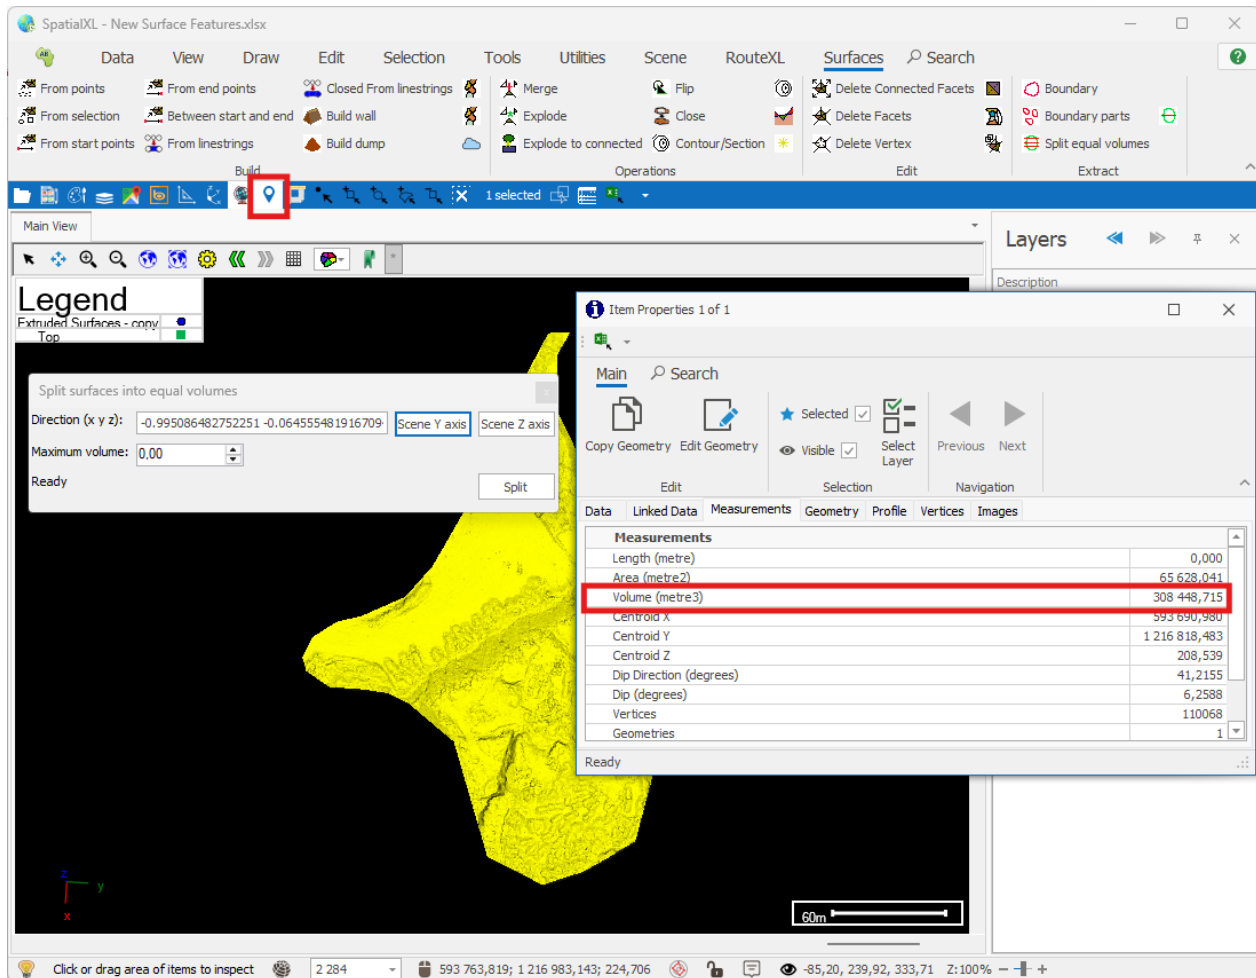

I will click the “Scene Y axis” button so that the direction of the split is horizontally across my scene Y axis direction:

Note: You can rotate your surface as desired first so that it splits across it in that orientation.

Next, you will specify the maximum volume of each split section when the surface is split.

Using the Inspector tool, I can see the volume of my current surface is approximately 300,000 m³ and so I will put a maximum volume of 100,000.

I can now go ahead and click the “Split” button and my surface will be split accordingly:

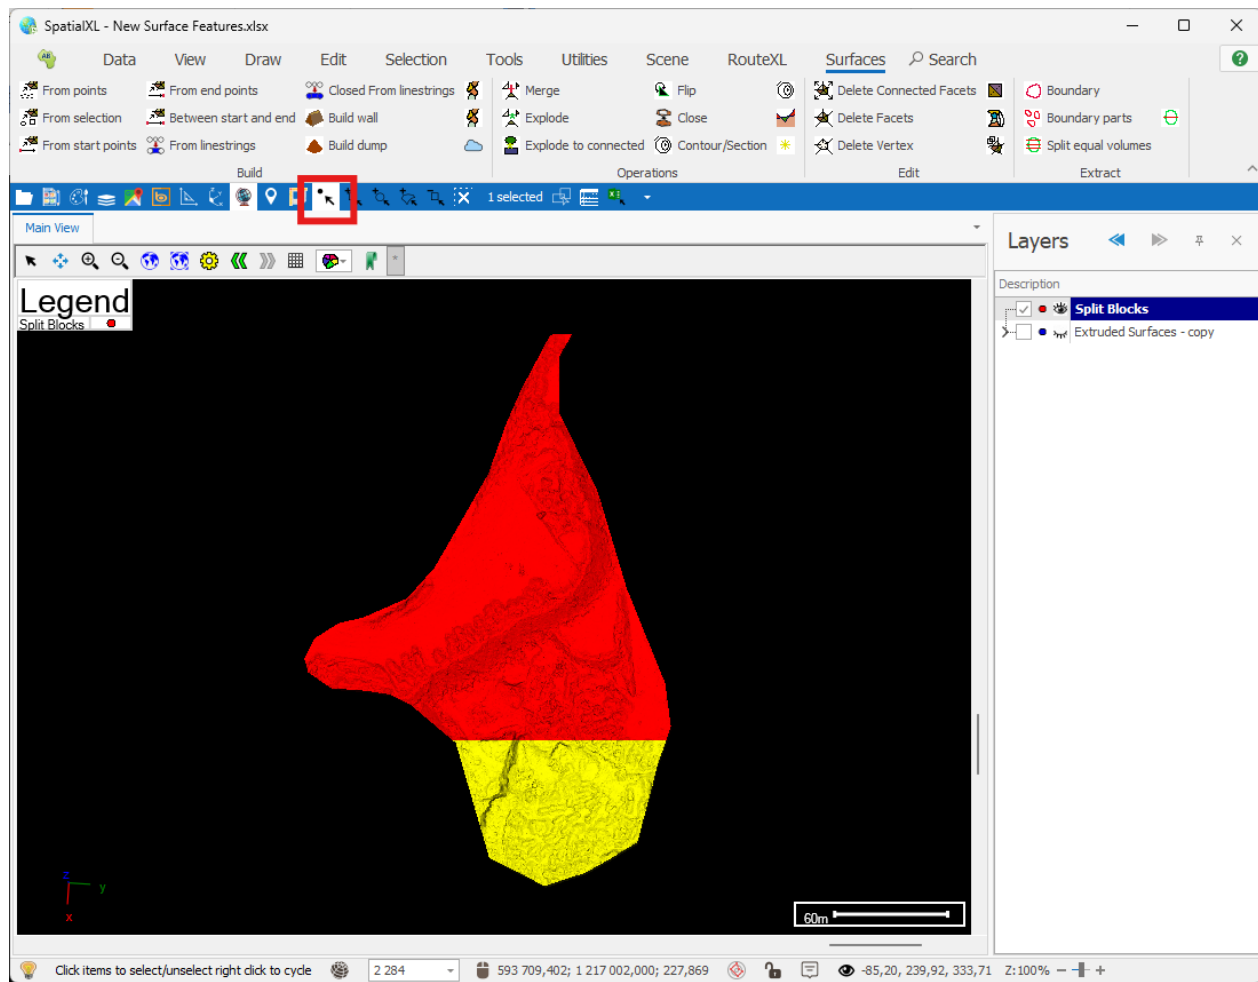

The split has now been done. To see the result, first clear your selected items in the scene:

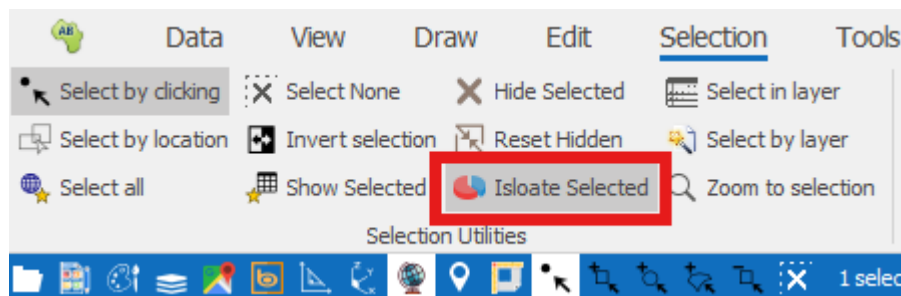

Then turn off your original layer with the surface so that only the layer with the new split surface is showing.

Then using one of the selection tools you can now select each part of the surface that it has now been split into:

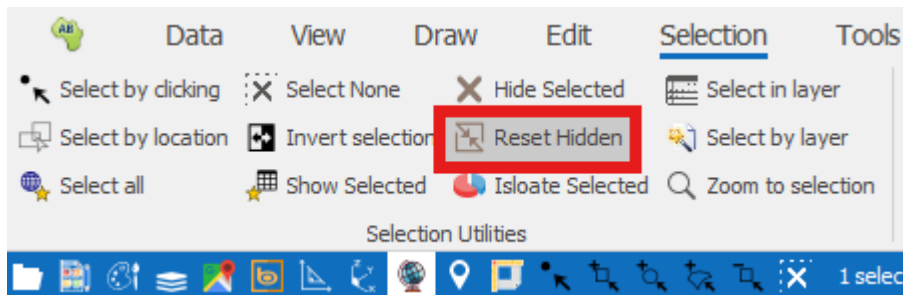

If you go to the Selection tab and click “Isolate Selected” it will then just show the exact section that you have selected:

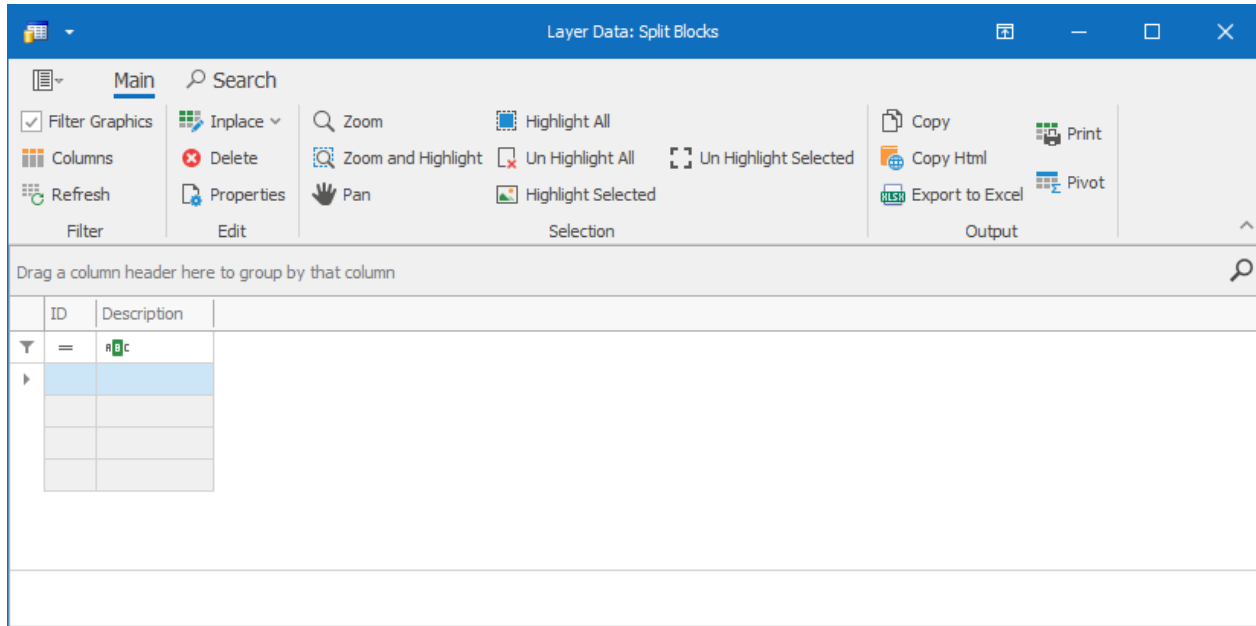

To reshown the hidden items simply click the “Rest Hidden” button in the Selection tab:

If you right click on the split surfaces layer you will see the data table for it with the 4 split sections that it was split into.

You can then capture IDs and Descriptions for the different split surfaces by typing them in the Layer Data Grid. For more data on working in the data grid please refer to the [Layer Data Grid Guide](#).

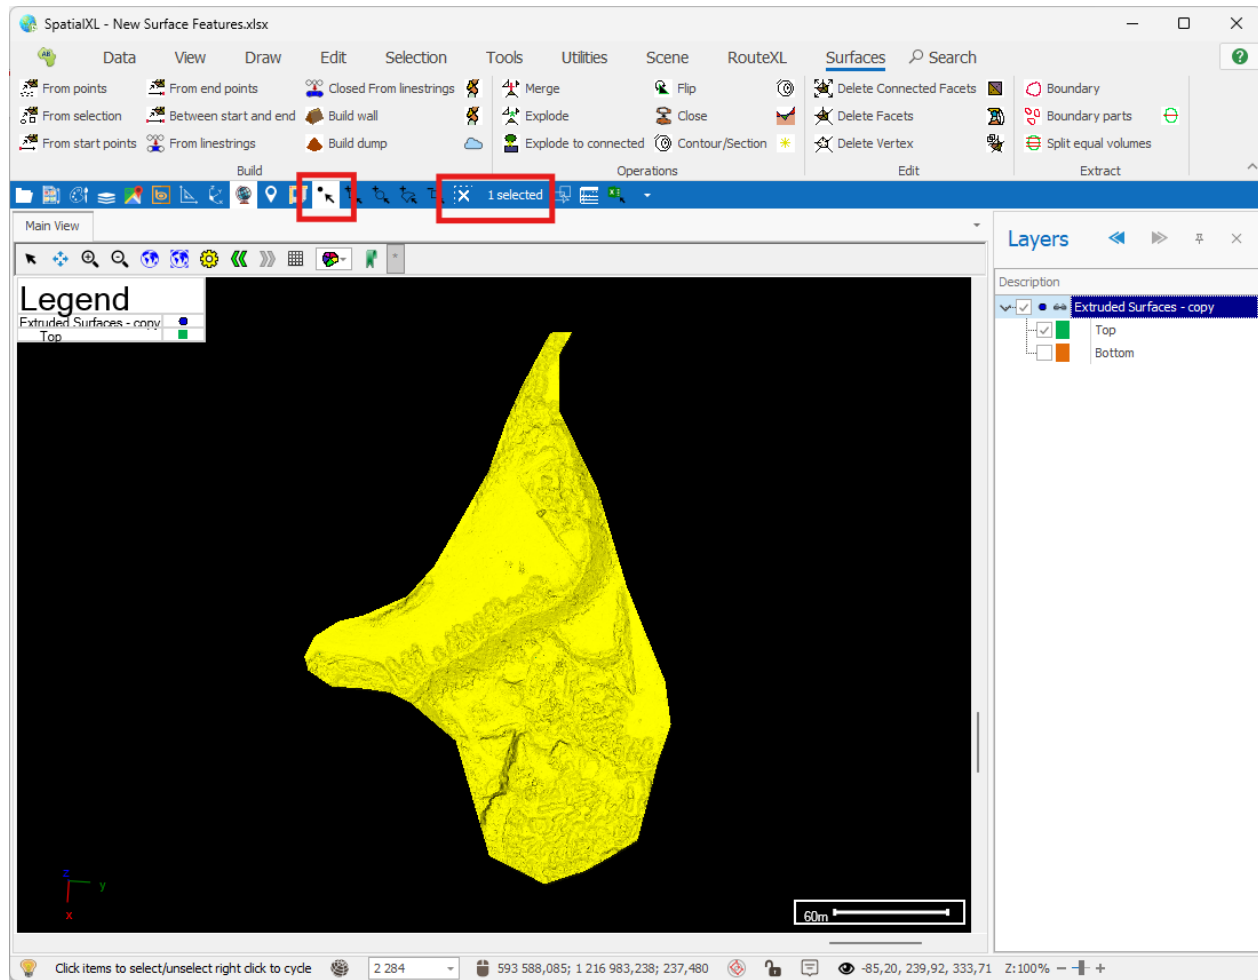

Split

The “Split” tool will allow you to do a manual split of a surface that you select.

It will by default do the split in the Y axis direction and it will allow you to see what the volume split would be when you click on different parts of the surface before you go ahead and do the split.

First, select the surface or surfaces using one of the selection tools:

Next, you will need to make sure you have an active layer for the split surfaces to go into. You can make an existing layer active (by right clicking on the layer and selecting “Active”) or add a new one.

To add a new one, you can click the “Add layer” button in the quick access toolbar:

Then, give the layer a name in the Description field of the Layer Properties box, then in the Data tab choose the layer to be created with an ID and Description column, then click Create and OK on the Layer Properties box:

New Layer [X]

Finally, make the newly added layer Active, by right clicking on the layer and selecting “Active”, so it can receive the surfaces we will split:

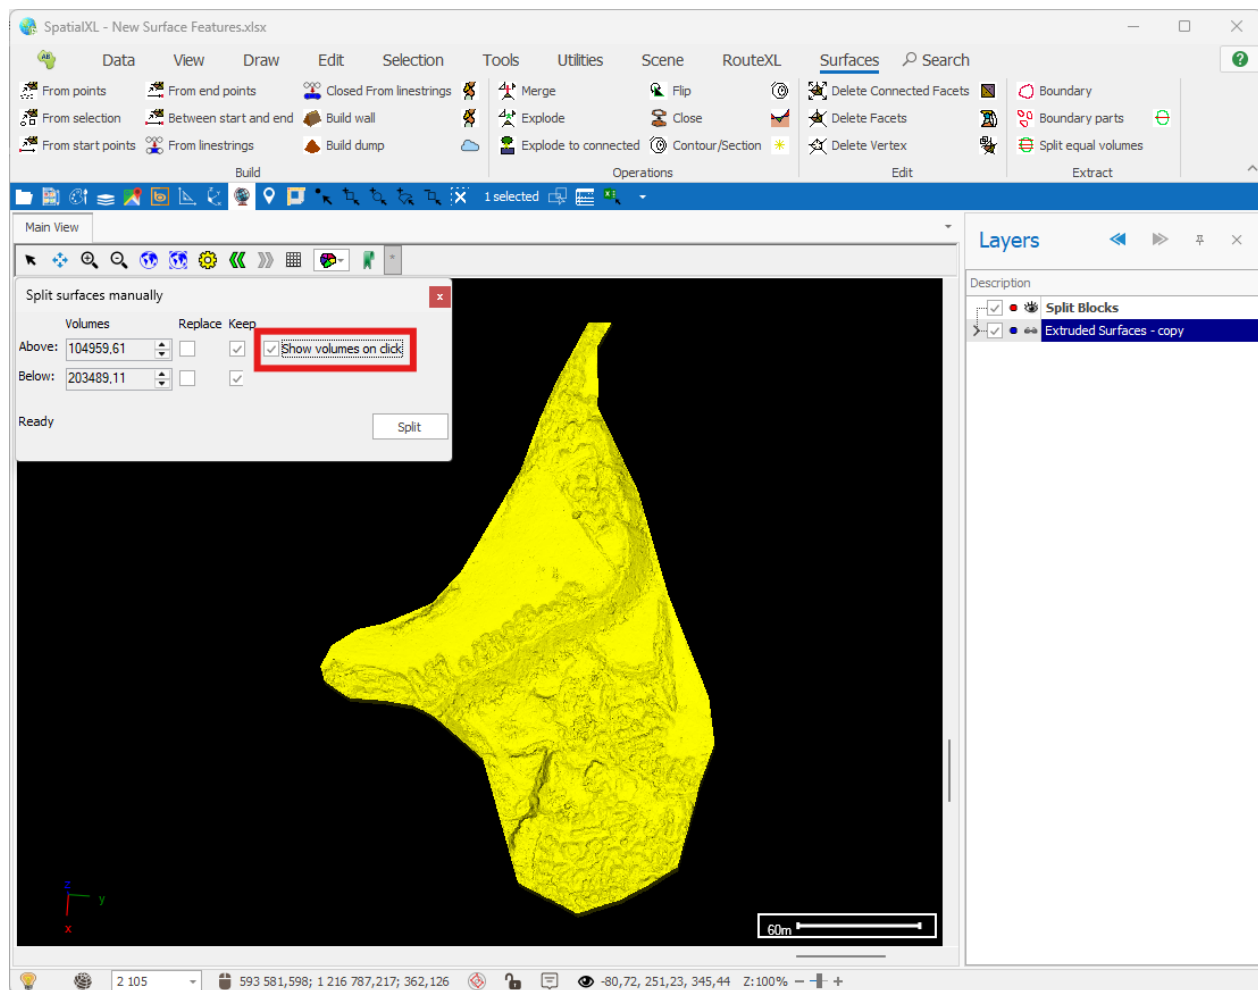

You can now open the “Split” tool.

The surface will be split horizontally across the fixed Y axis of the screen as you look at it, so you can rotate the scene in the desired orientation, and it will still split the surface accordingly. The “Above” field will show what the volume of the higher (vertically as you look at the screen straight) section of the surface split will be and the “Below” field will show the volume of the lower section of the split.

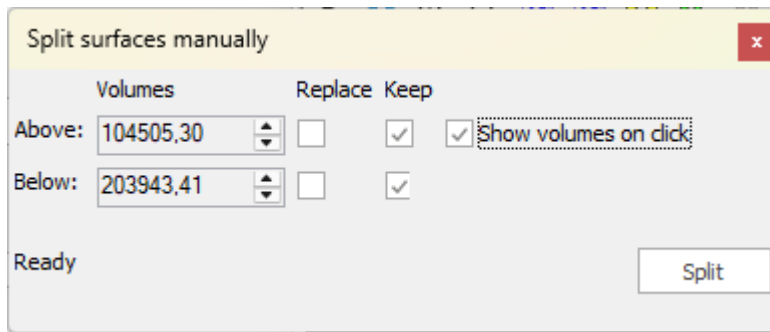

Check on the “Show volumes on click” box and then as you click on different parts of your surface the volumes will populate. Once you are happy with the Above and Below breakdowns you can go to the next step.

The “Replace” and “Keep” checkboxes work as follows. You can choose to have either of the two halves of the surface *replace* that part in the original whole surface. If you only choose “Keep” and not “Replace” then these split sections will be added in addition to your existing surface. You can also choose to keep only one of the halves of the surface or both.

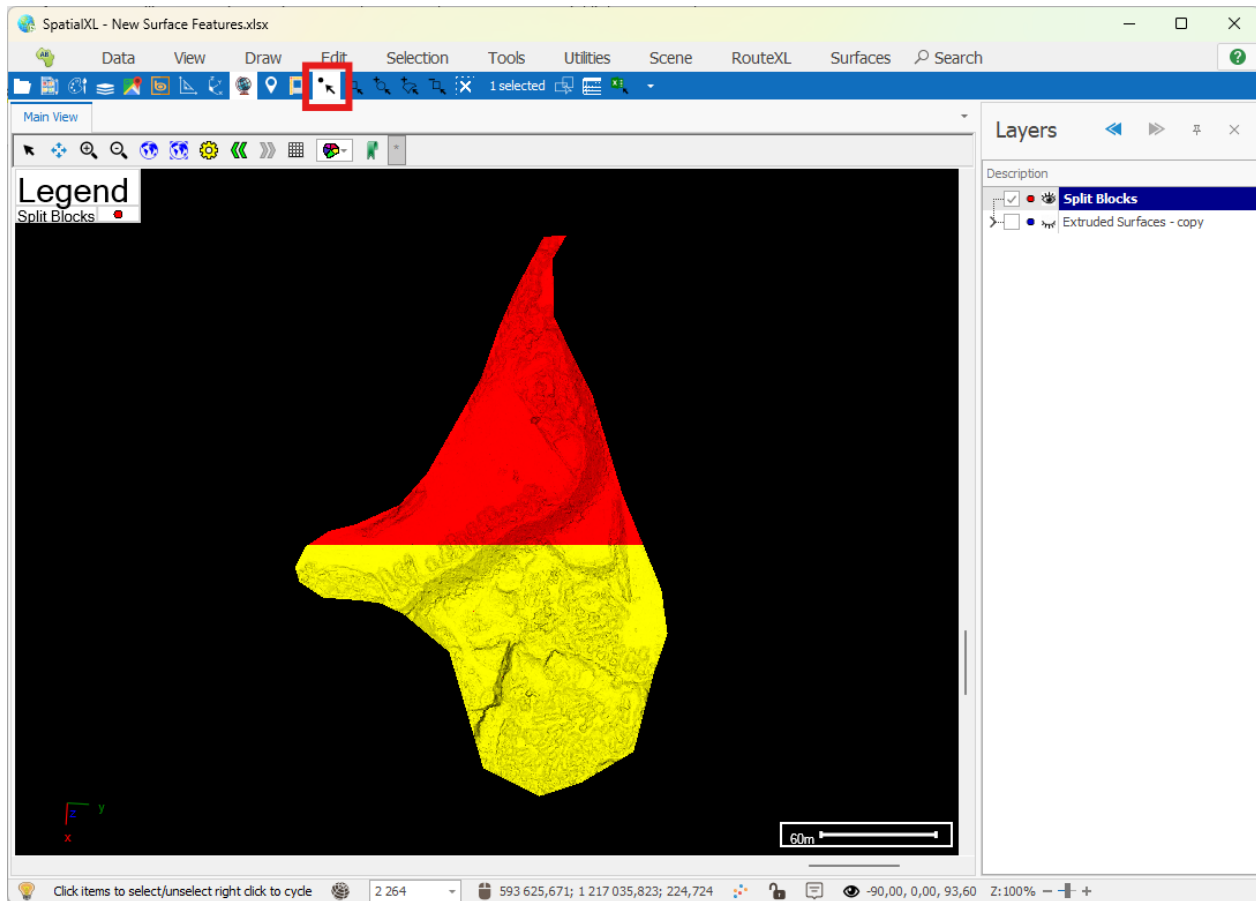

If you have “Replace” checked on for either part, then the “Keep” checkbox for that part will not apply, only the “Keep” checkbox for the other part will have an effect and optionally keep the other part or not.

In this example I will keep both parts and will not replace the original surface.

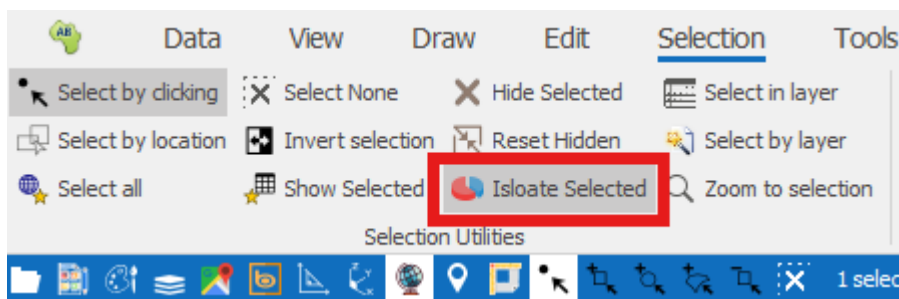

You can then go ahead and click the “Split” button, and the newly split surfaces will be added to your active layer.

Then using one of the selection tools you can now select each part of the surface that it has now been split into:

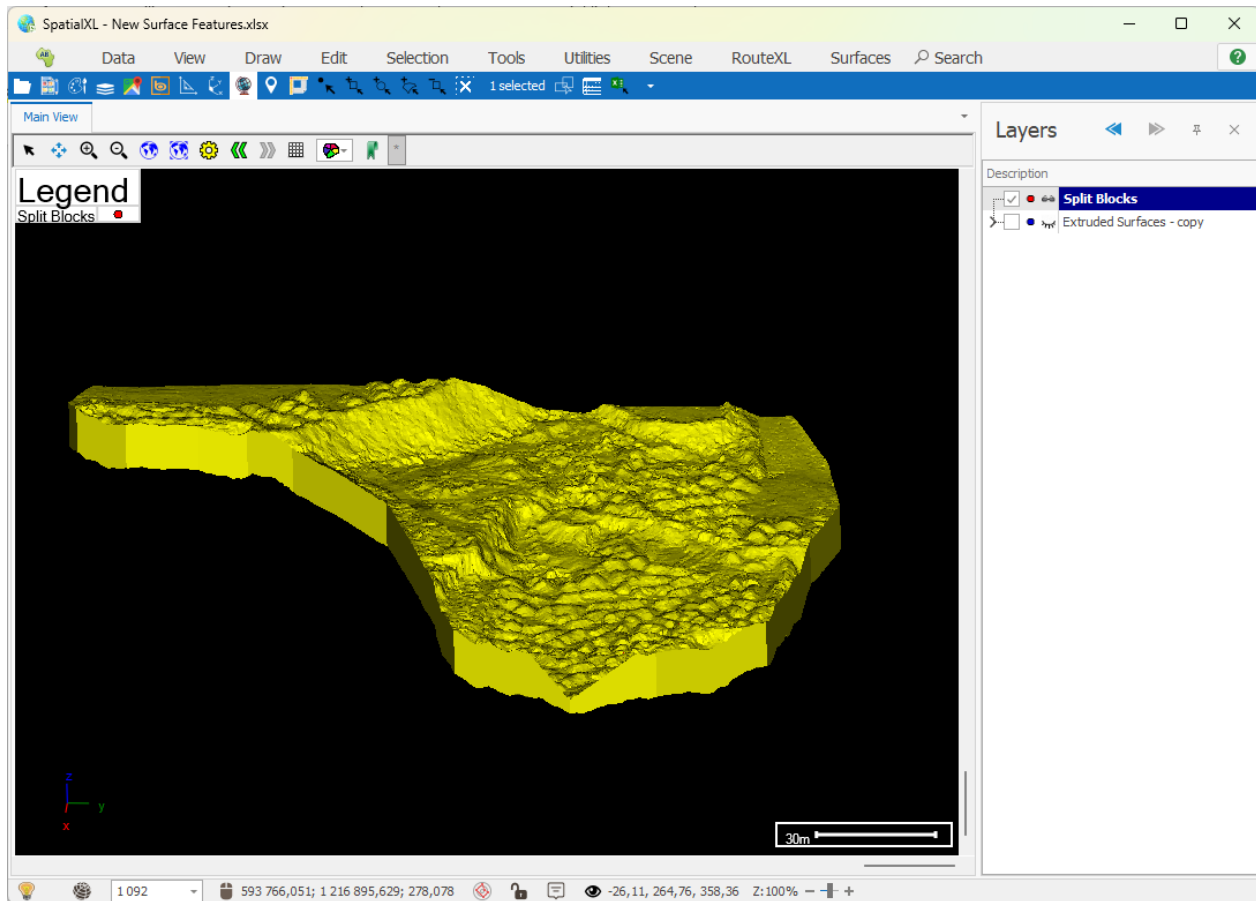

If you go to the Selection tab and click “Isolate Selected” it will then just show the exact section that you have selected:

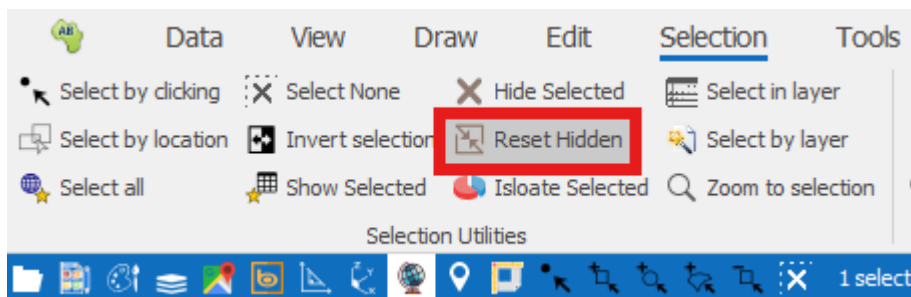

SurfaceIQ User Guide

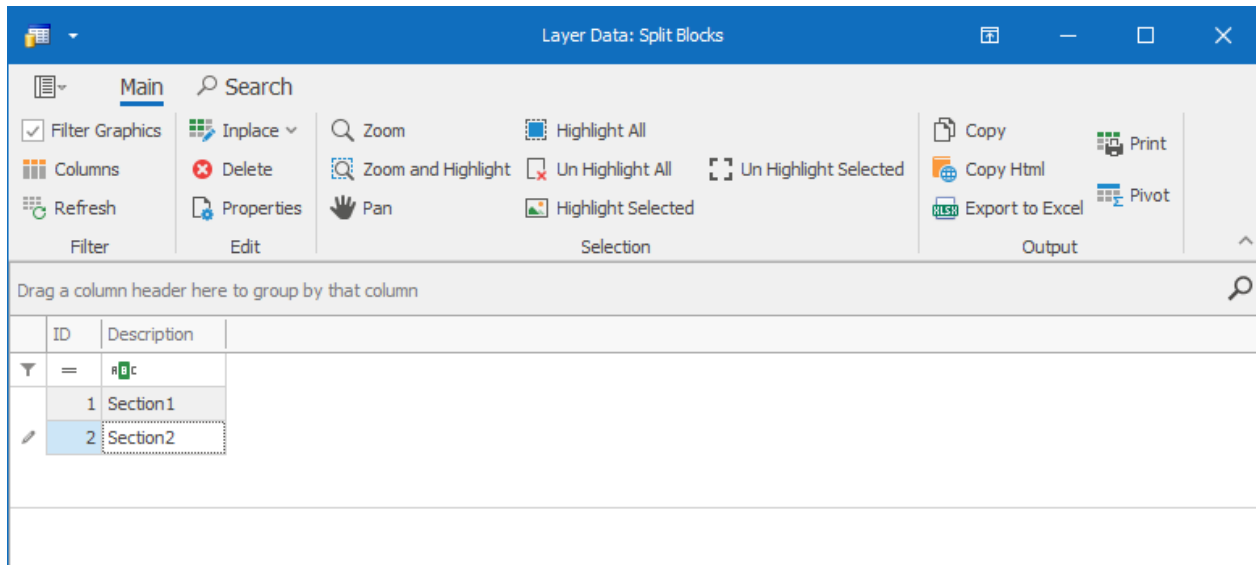

To reshown the hidden items simply click the “Rest Hidden” button in the Selection tab:

If you right click on the split surfaces layer you will see the data table for it with the 2 split sections that it was split into.

You can then capture IDs and Descriptions for the 2 split surfaces by typing them in the Layer Data Grid. For more data on working in the data grid please refer to the [Layer Data Grid Guide](#).

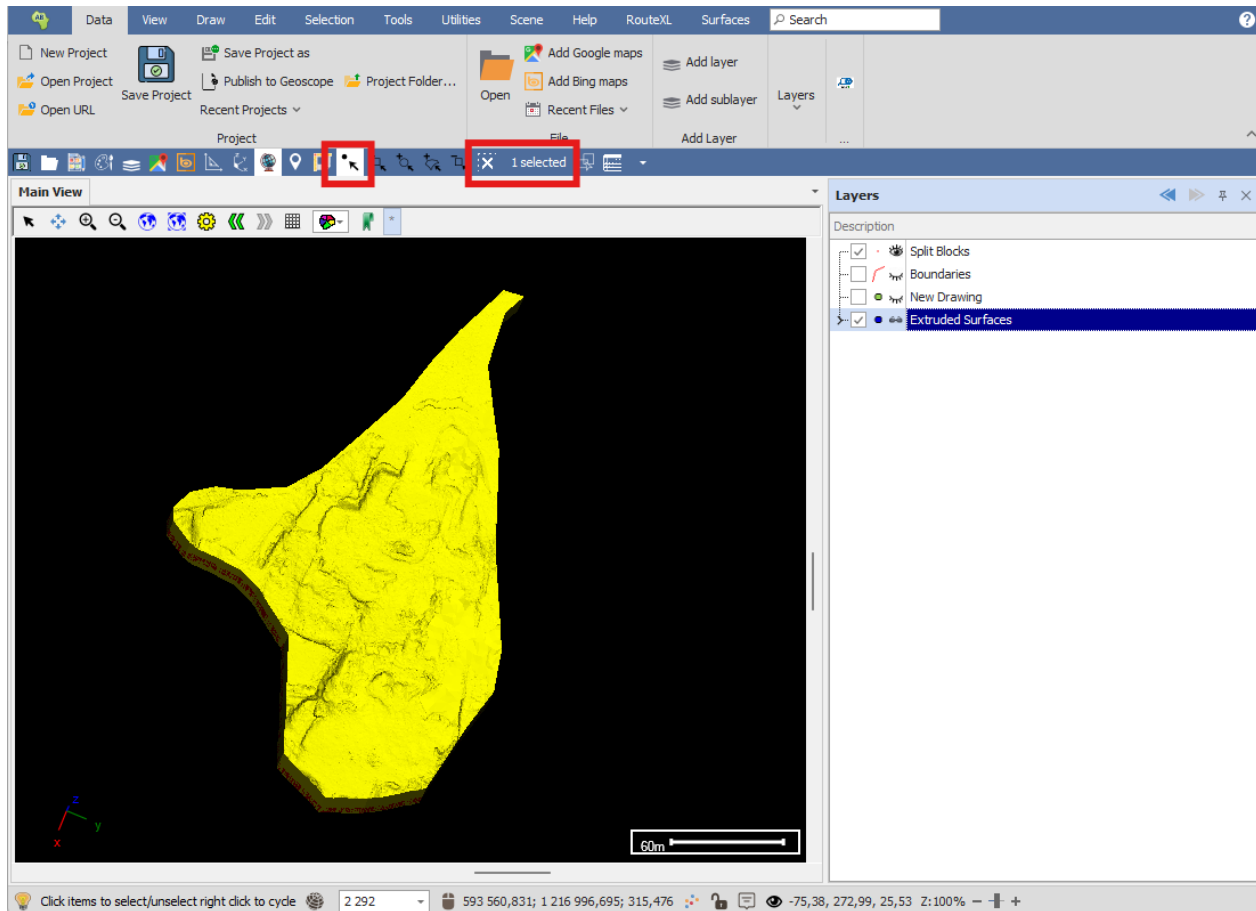

Tips and Extra Information

Volumetrics

You can get volume and other measurements of your surfaces in a couple of ways.

Selection

Simply select the surface using one of the selection tools. Then, click on the Selected Items box where it shows the number of selected items:

This will bring up data about the selected object including Area and Volume. Units are by default always in meters.

Selected Objects ✕

Drag a column header here to group by that column

	Geo...	Layer	Length	Area	Volume
▼	=	REC	=	=	=
▶	⊕ ...	Extruded Surfaces	0,0000	80 573,8306	871 155,1169

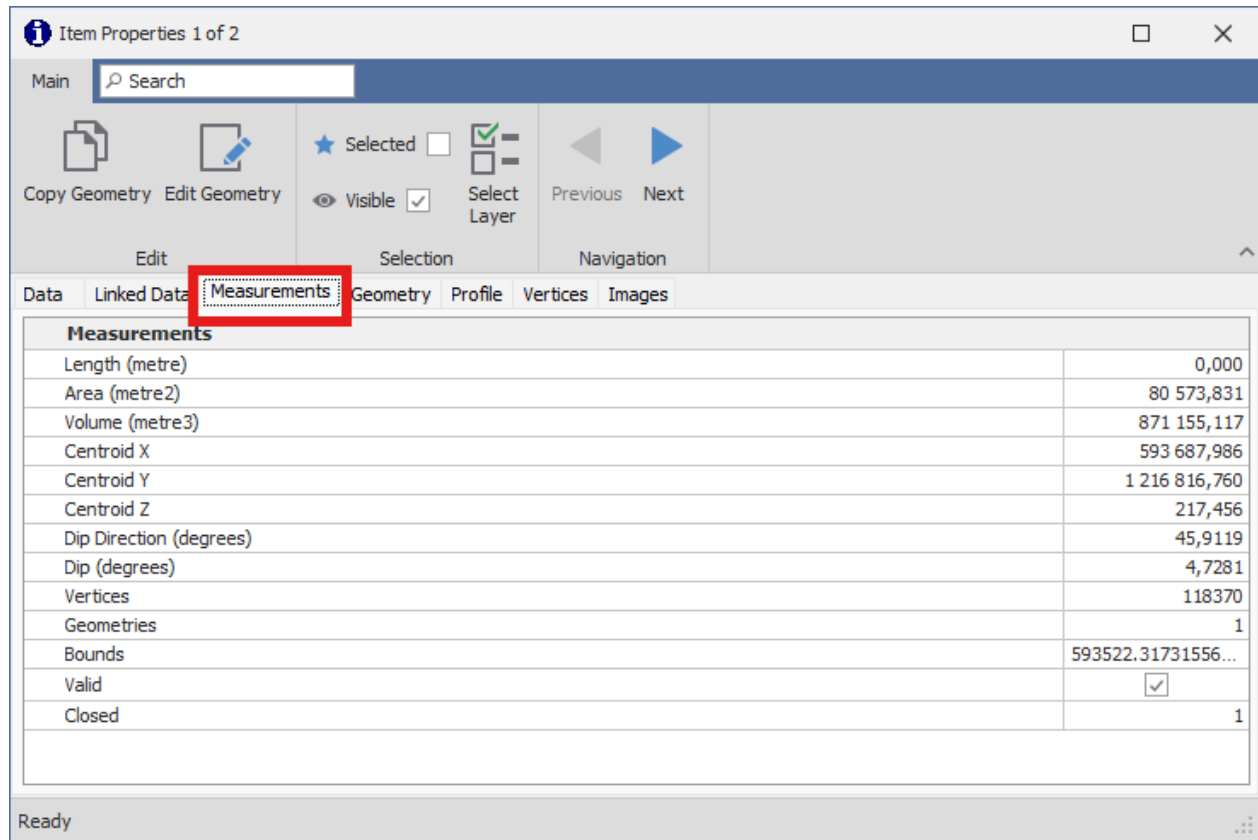

Inspector Tool

You can use the Inspector tool to get detailed measurement information about your surface.

Launch the Inspector tool, then click on the surface in the scene and the Inspector window will populate with information about the selected object. Then go to the Measurements tab of the Inspector window and you will see detailed measurement information about the object. Units are by default always in meters:

SurfaceIQ User Guide

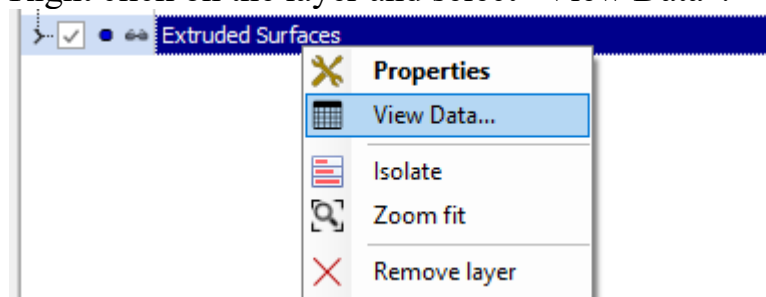

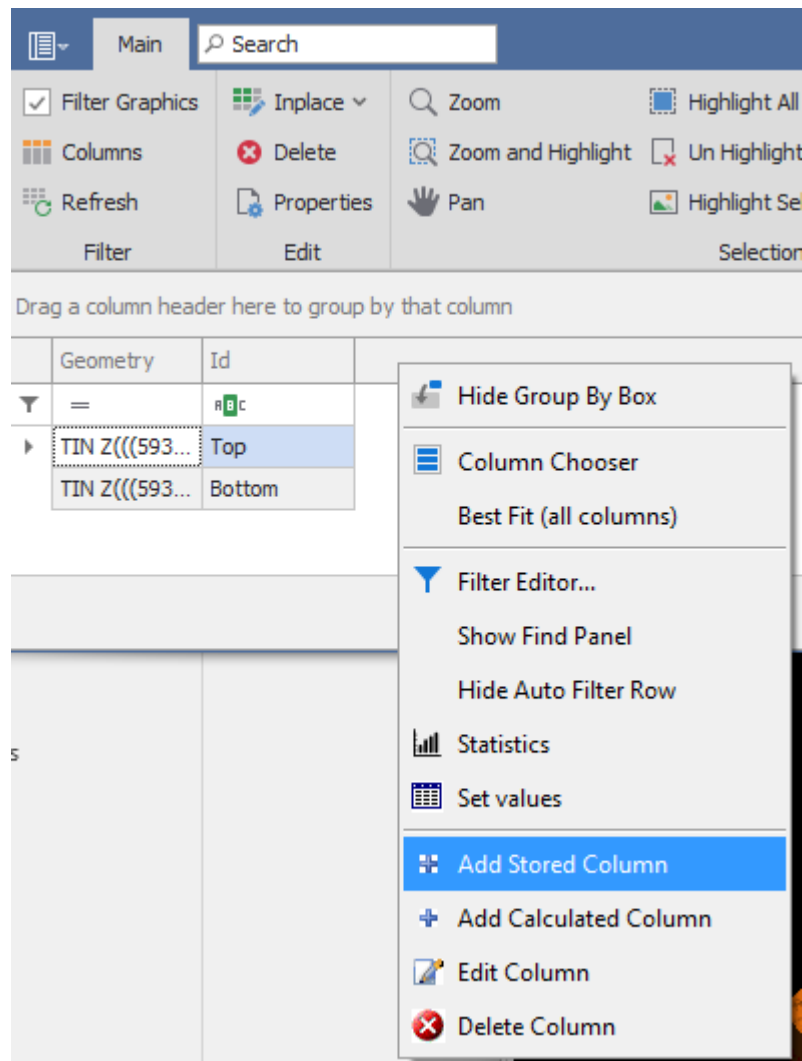

Adding Columns in the Layer Data Grid

If you want to actually store the volume or area etc. information in the data table of the surface layer, you can add a column as follows.

Right click on the layer and select “View Data”:

Right click in the column header area of the grid and select “Add Stored Column”:

Give the column a name and make sure it is of a number type; Double Precision is normally a good type to choose for number columns:

Column Properties

Column Properties Initial Values

Column Name: Volume

Type: Double Precision

Width: -1

Format:

☐ Read Only ☒ Visible ☐ Required ☐ Key ☐ Unique

☐ Lookup values from a layer or list

OK

Go to the Initial Values tab and drop down on “Insert Calculation”, then choose the calculation you want such as “Volume (m3)”:

Column Properties

Column Properties Initial Values

Initial Value Expression

Insert Column Insert Calculation Check

Selected

Visible

Length (m)

Length (km)

Area (m2)

Area (km2)

Volume (m3)

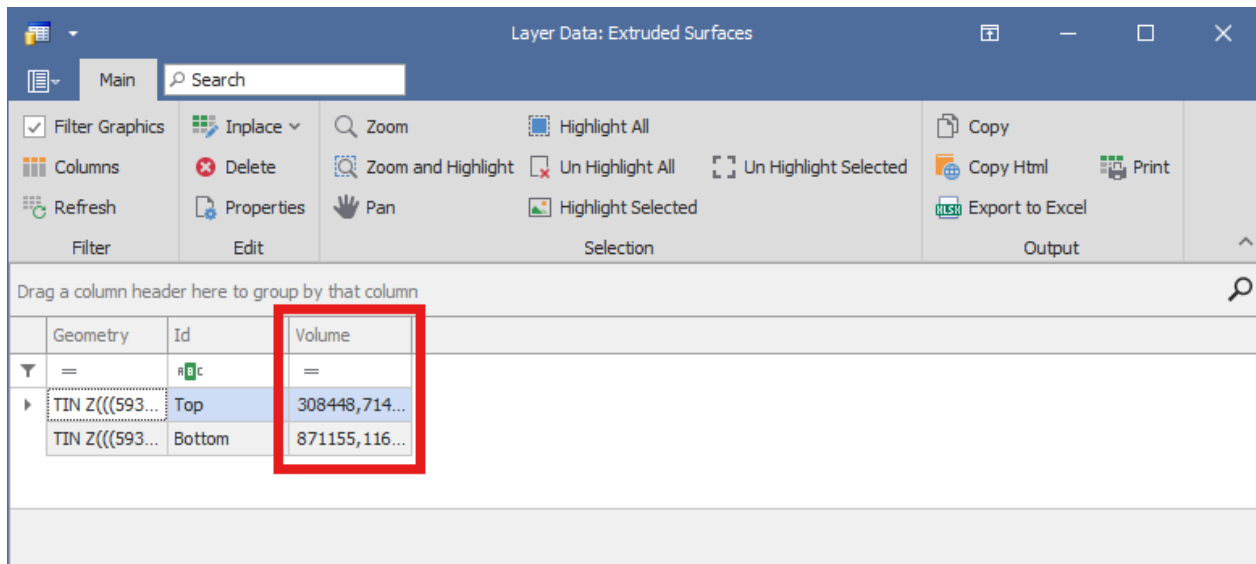

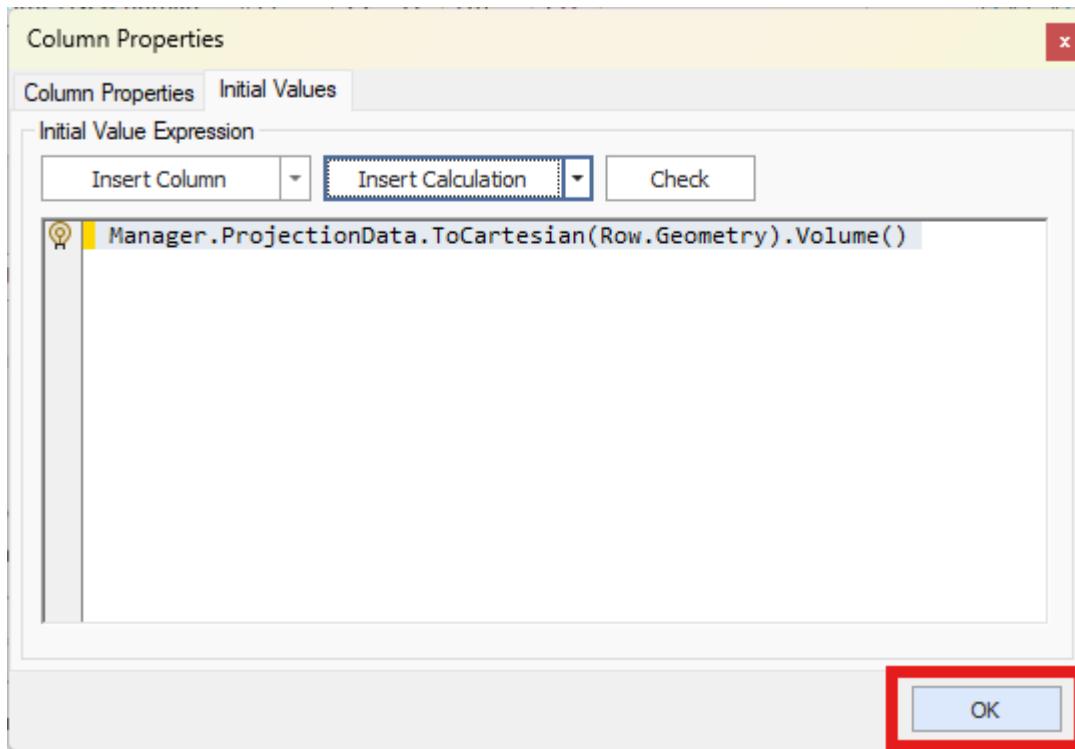

Distance (m)

VertexCount

IsClosed

OK

Finally, click OK and the column will be added:

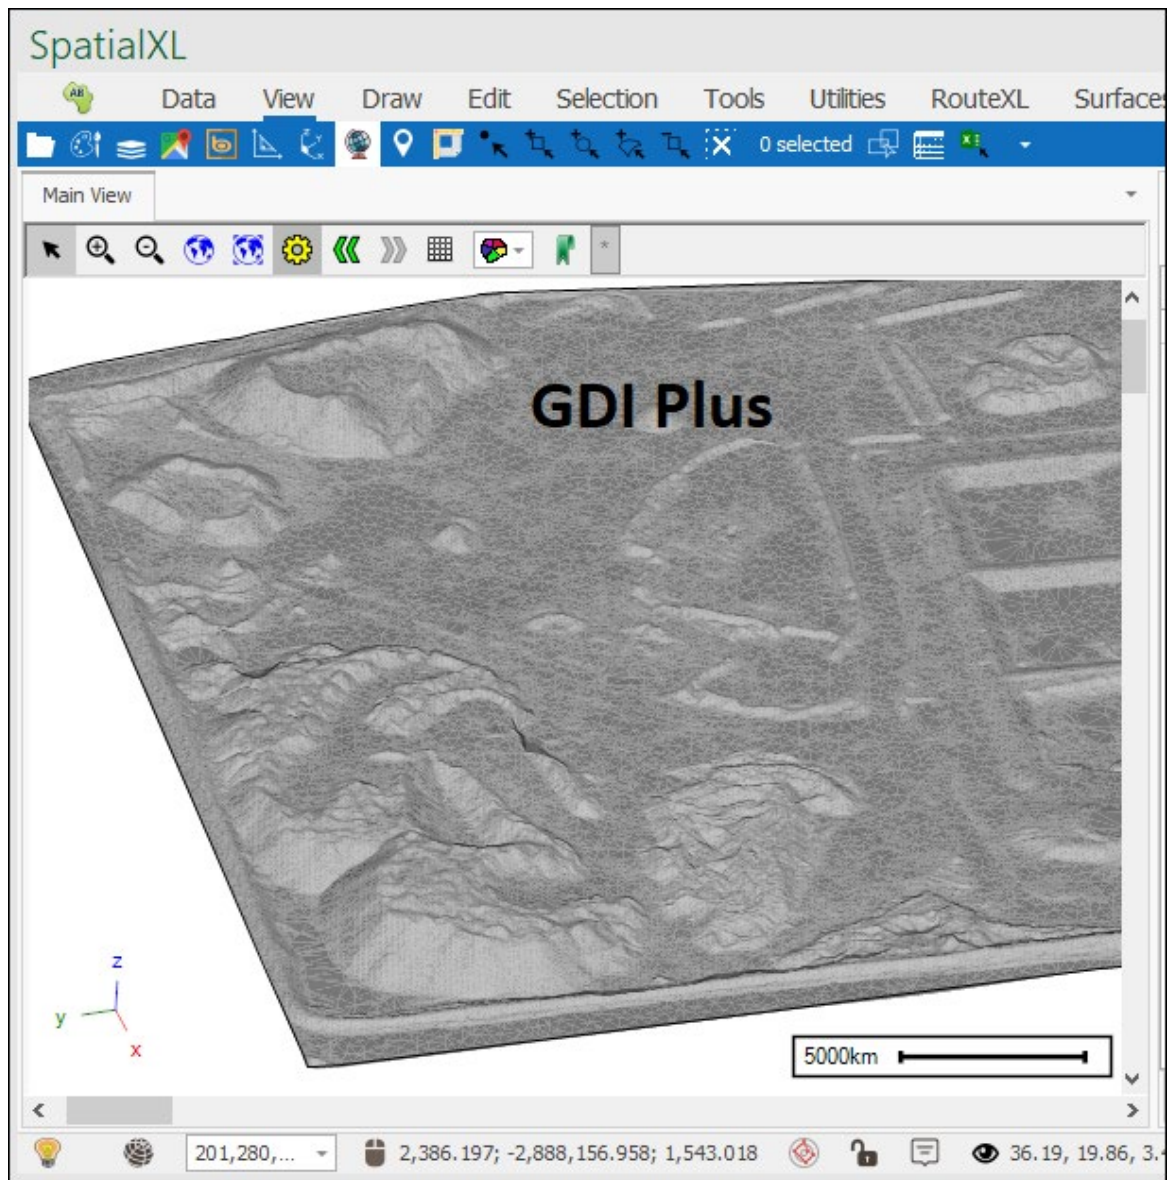

You can then add more columns following the steps above for other calculations such as Area.

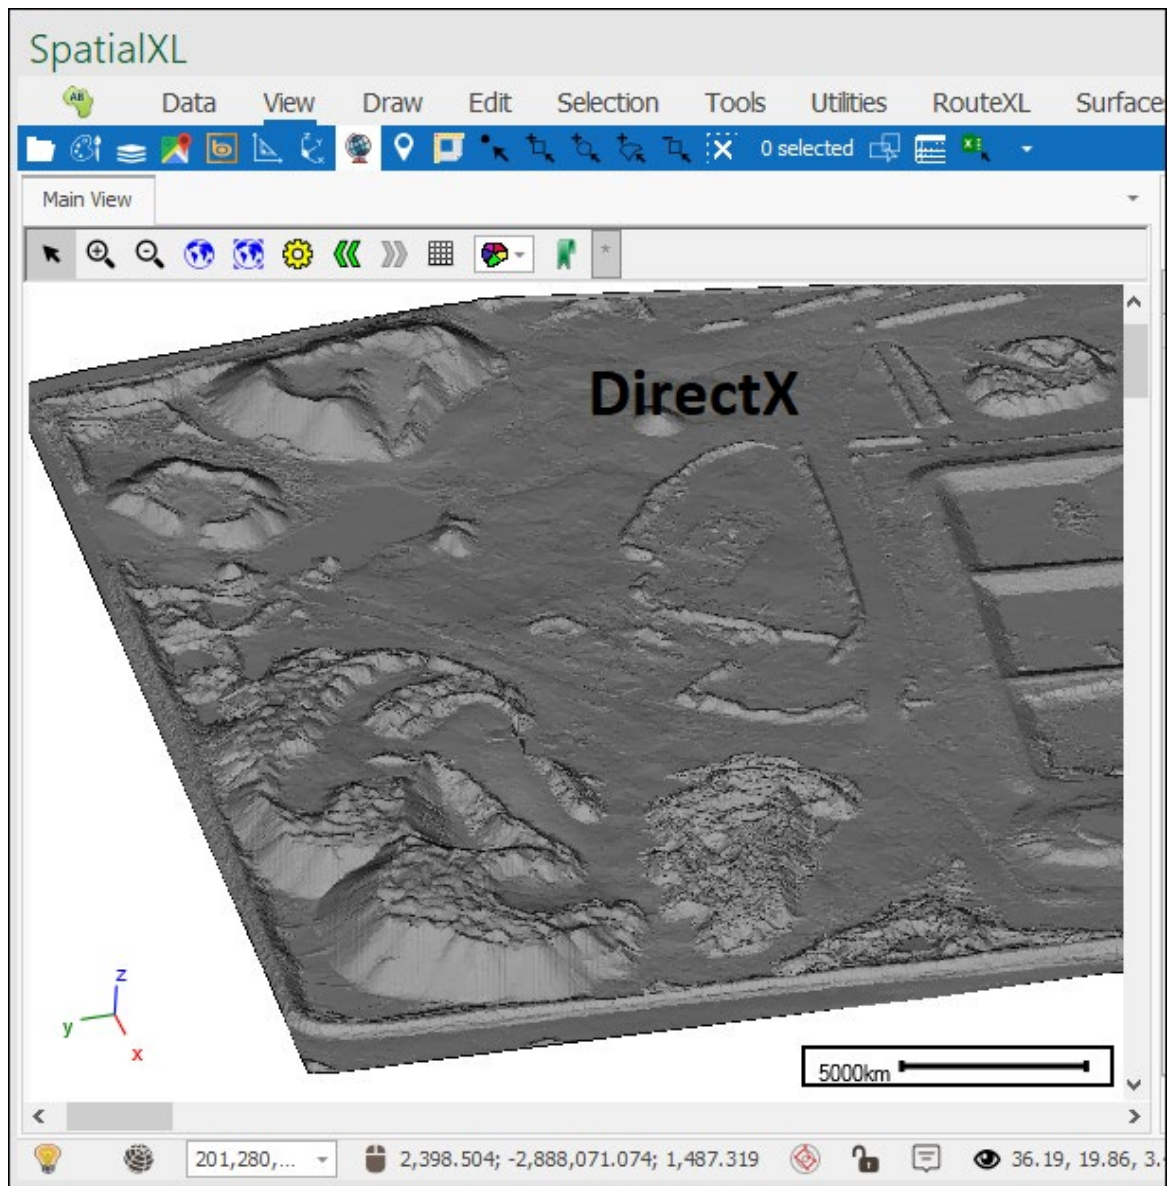

Warning: If your layer is externally referenced, meaning it is pointing to a file stored elsewhere on your computer and not internalized into the project, then when you add new columns to the layer data grid they will not automatically be remembered the next time you reopen your project and the file is reloaded.

You will either need to save the layer by right clicking and selecting Save>Save Layer Data, in order to save the new columns back to the original external file, or alternatively, you will need to internalize the layer so that it is no longer externally referenced by right clicking on it and selecting Advanced>Make Internal.

DirectX

When using SurfaceIQ to create various surfaces the best renderer to use is DirectX. This renderer is higher performance than GDI Plus and shows a smoother surface whereas GDI plus will show the triangulated irregular network on the surface:

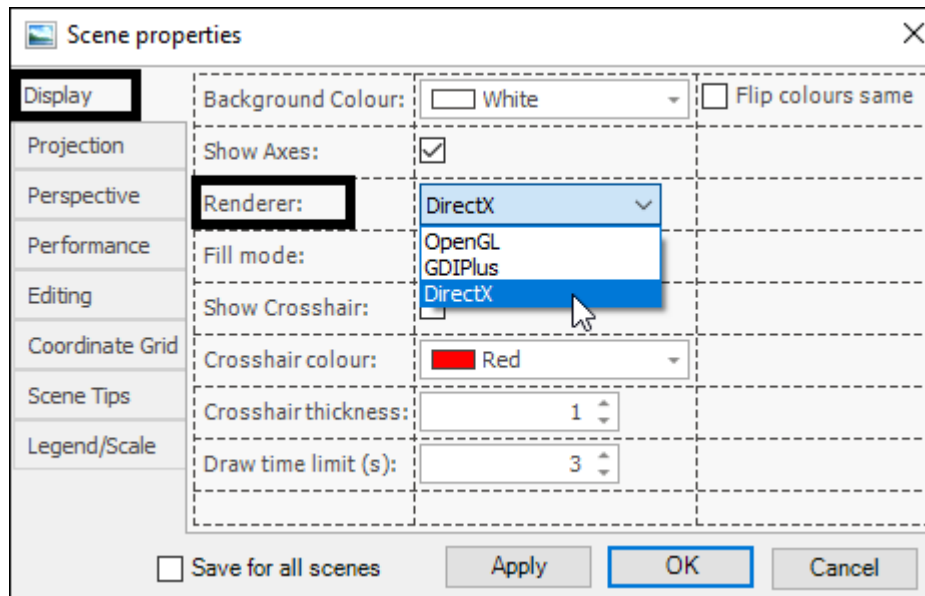

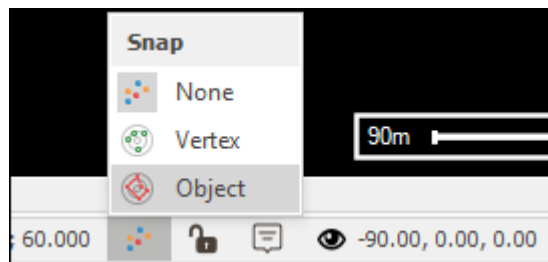

To set the renderer go to **Scene Properties**:

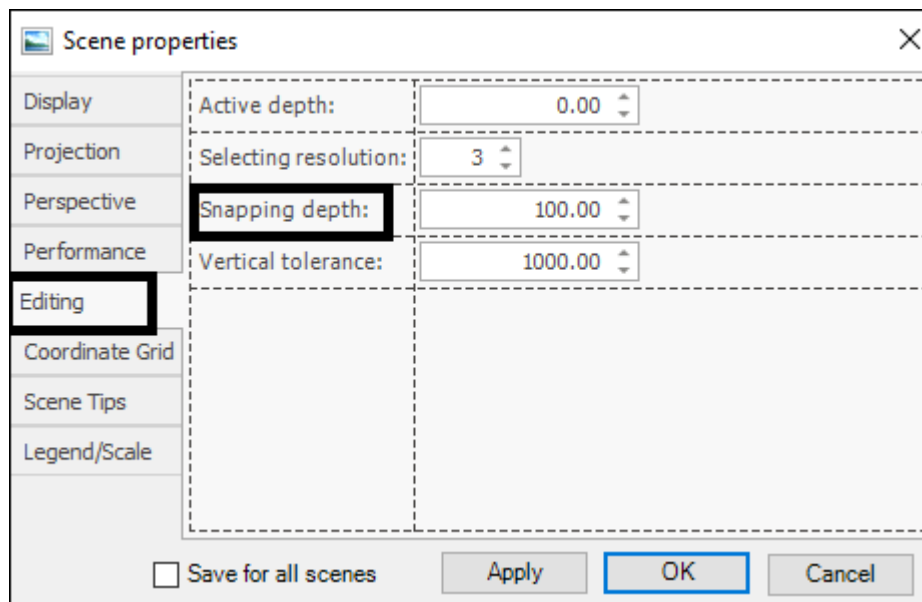

And in the **Display** tab by **Renderer** you can choose the renderer:

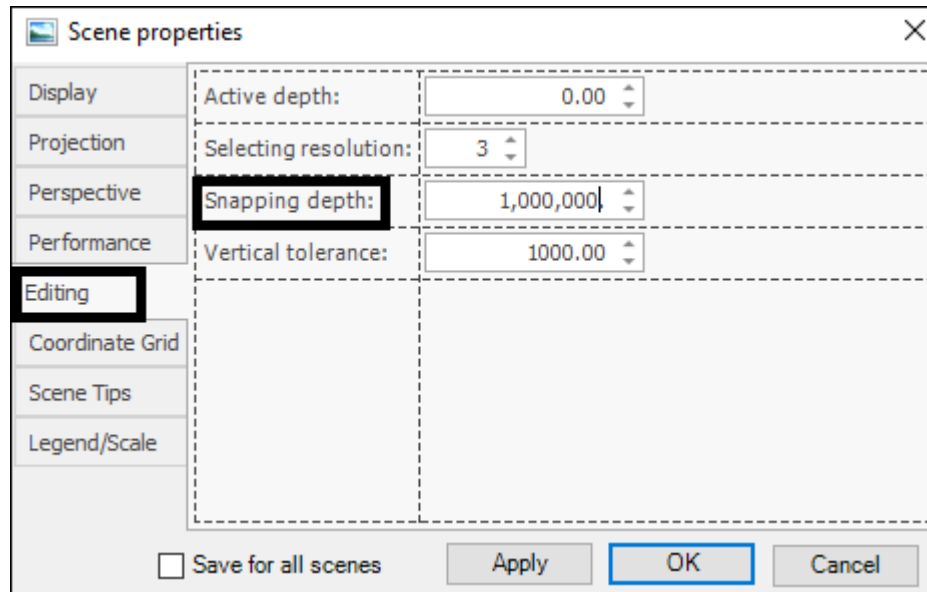

Snapping Depth

In using any of the snapping tools sometimes you might find that you are unable to locate a point to snap to on your surface and in this case it means your snapping depth is set too low. To fix this go to **Scene Properties**, **Editing** tab, and by **Snapping depth** you can change this to a higher amount:

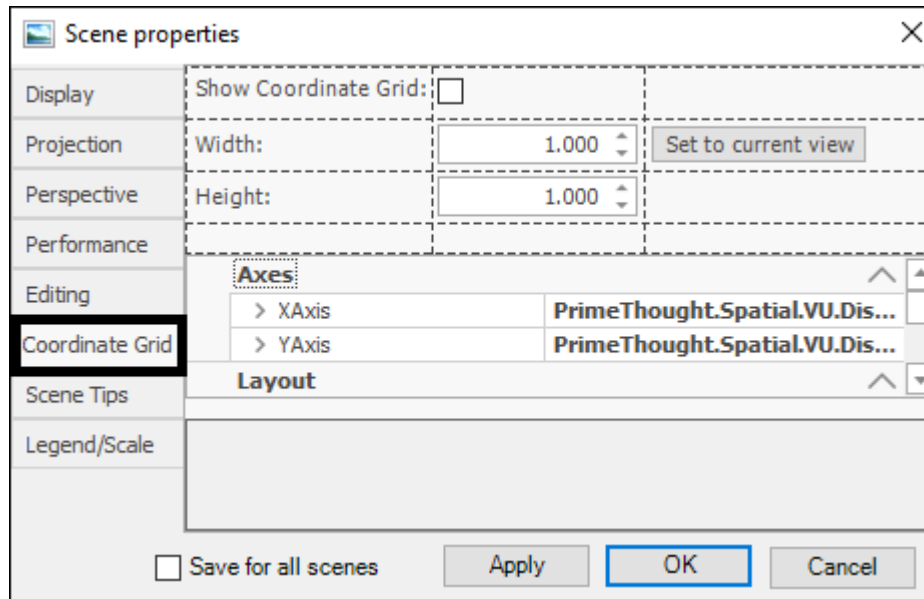

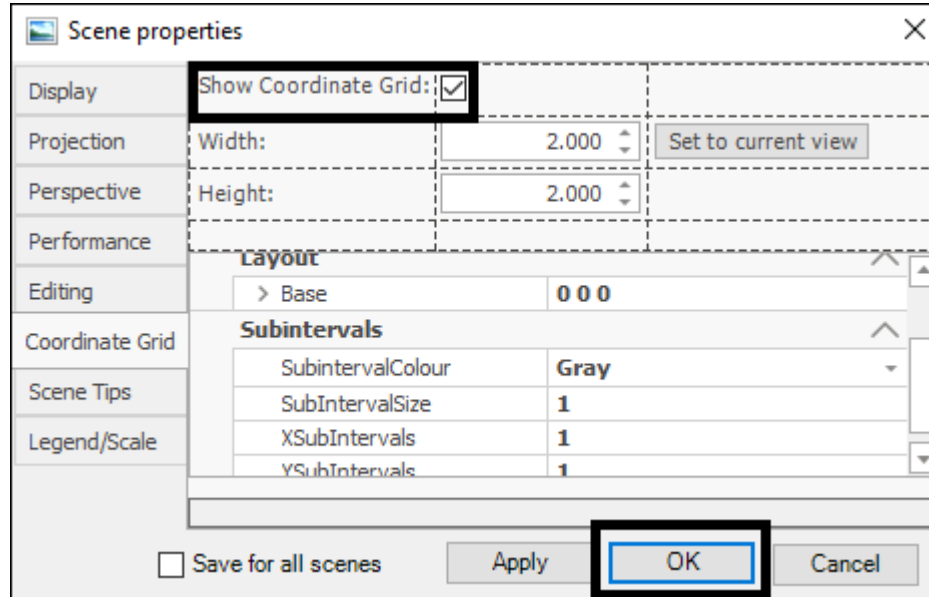

Coordinate Grid

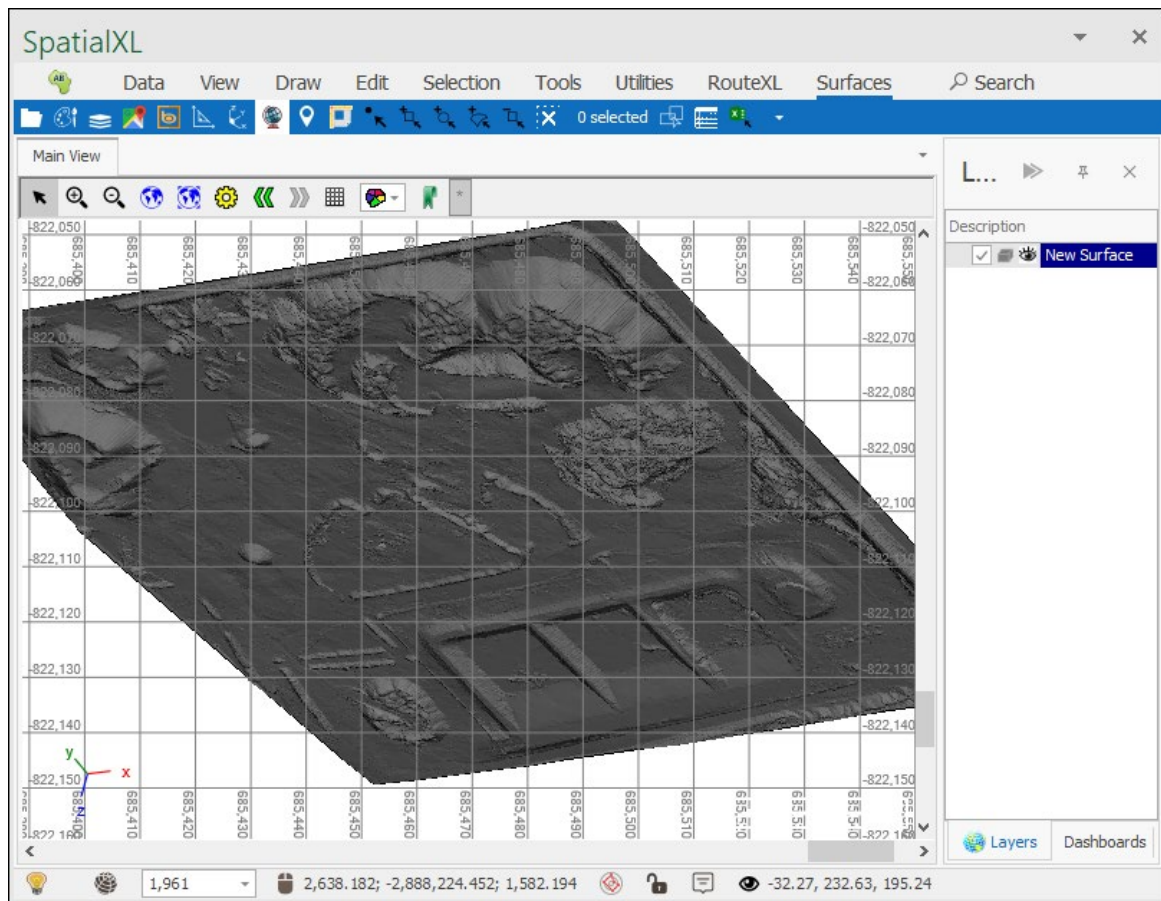

In your scene you can turn on a coordinate grid which can be useful when working with surfaces, to do so got to **Scene Properties**, **Coordinate Grid** tab:

Make sure to have **Show Coordinate Grid** ticked on and then you can choose various settings for the grid below, when done click **OK**:
